ACKNOWLEDGEMENT

I would like to express my sincere gratitude to Hugo Ladeira, Pablo Vercelli and the entire enterprise C-Level Team, for allowing me to undertake this work.

I am grateful to my Supervisor Associate Professor Ph.D. Walter Bataglia Department of Business Administration for his continuous guidance advice effort and invertible suggestion throughout the research.

I am also grateful to Ph.D. Joel Dutra, executive leader of Administration Foundation Institute for providing me his valuable suggestion to carry out my research successfully. My special thanks to the examining board members, professors Andre Luiz Fischer, Ph.D., Fabio Tescari, Ph.D; Gilberto Perez, Ph.D; and Maria José Tonelli, Ph.D for their relevant and valuable contributions to the raise the bar of the research experience.

My utmost gratitude to my nuclear family Fernanda, Pedro and Rafael Baptistucci for supporting me across this entire learning and development journey, their tireless help were key for keeping me on track during this pathway.

Lastly I would like to express my sincere appreciation to my parents especially my mother and father for encouraging and supporting me throughout my entire study journey since I was a kid hungry for knowledge.

ABSTRACT

Over the past few decades, capitalism has developed under a different political and economic crises, gradually leading to a more forceful inclusion of studies on social issues, bringing the economy close. Nevertheless, those crises provoked that new trend emerges that begins to recognize the importance of the collectivity in its particularities in the more specific institutional context in organizations to sociology itself. During this period, the academy directed more explicitly the studies of the foundations and functions of institutional theory as the mechanisms that control the behavior and functioning of society. Therefore, this thesis addresses the problem which resides at the multinational companies that operate across the globe in different geographies where there are institutional dynamics variances on understanding the cross-countries impact on the general organizational engagement results engagement. This is quantitative research that uses an organizational engagement survey on the 5-point Likert scale applied in 18 different countries with 3266 respondents. Comparisons were conducted country by country, covered by using variance analysis (ANOVA) with Games-Howell post-hoc tests with a 95% of confidence level Finally, A significant impact of the informal rules (institutional dynamics) on the results of organizational engagement were observed, rejecting the null hypothesis. Additionally, a significant reverse correlation between Assertiveness and Employee´s Engagement; and a significant directly correlation between Collectivism and Employee's Engagement could be observed. These results strongly corroborates with the new social trend discussion, as the different sociopolitical realities should be observed to a better understanding their impacts.

Keywords : institutionalism; informality; organizational engagement ; institutional dynamics.

1 – INTRODUCTION

1.1. HISTORICAL BACKGROUND

Over the past few decades, capitalism has developed under different political and economic crises, gradually leading to a more forceful inclusion of studies on social issues, bringing the economy closer to sociology itself. Although it has its origin in the economy, over the past few years, the academy has directed efforts to more explicitly study the foundations and functions of institutional theory itself. Institution has become a frequent term for determining mechanisms that govern the behavior and functioning of society (NORTH, 1990).

Nevertheless, those crises provoke the emergence of a new trend that begins to study and recognize the importance of the collectivity in its particularities in the more specific institutional context in organizations, Scott (1995) comments. Organizations are treated as significant units and a relevant part of the social universe. Organizations, particularly in view of the breadth of social institutions, are perceived as potential links between individuals and the social world (ALDRICH & REUF, 2006).

The capitalism´s progress and crises over the past few decades has meant that the term institution and institutionalist theory itself establish an important space in the studies of economics and sociology. During this period, the academy directed more explicitly the studies of the foundations and functions of institutional theory itself. Institution has become a frequent term for determining mechanisms that control the behavior and functioning of society (HODGSON, 2015).

As previously discussed, those institutions assume a relevant role in the social life to forge the habits, beliefs and values of a set of collective interactions within a community delimited in a boundary well defined. As mentioned by Hindriks and Guala (2015), Institutions are ubiquitous. Even simple descriptions of who human beings are or what they do would be very difficult if they could not use institutional terms. Since our behavior is constantly influenced by institutional entities and institutional roles, institutions have always been a central topic of research in the social sciences. But institutions are also called philosophic for a variety of reasons. Institutions are peculiar products of human activities, to begin with, and may hold the key to understanding our special place in the natural world. This evidence supports science perspective that humans are the only animals who can build diverse social organizations and who constantly invent new ways of living together.

Believing that Institutions depend on people interactions and beliefs shared that redefine rules to reestablish the order as mentions by Feldman and Pentland (2003), transaction inside the system becomes an important actor which improves or reduces complexity. In that way, North (1990) has made the significantly contribution, positing that when it is costly transact institutions matter, neither he nor most of his followers have explored how property rights and other institutions come about. Throughout most of history and in much of the present world institutions have not provided the credible commitment necessary for the development of low-cost transacting in capital and other markets. There is, therefore, little evidence to support the view (apparently implicitly held by many economists doctoring the ailing economies of central and eastern Europe) that the necessary institutions will be the automatic outcome of getting the prices right through elimination of price and exchange controls.

Indeed, under all institutions theory discussed with the various research resides the idea that systems of rules should be created, modified and updated by the people interaction as mentioned by Nelson and Winter (1982) where define that Institutions are structured system of embedded social rules. Social rules presume those interactions regulated by laws of patterns defined by the society, firms, or corporations. At the beginning of the 19th century, Brown (1905) already defined that the corporation is a legal subject of right and duties, Hodgson (2015) reinforces that firms in transaction cost economy are clearly legal entities. Machlup (1967) argued differently. He listed no less than ten concepts of the firm employed in the literature of business and economics and suggested that even more were in use. He argued that the firm had been regarded as an organization, a decision-making system, a collection of assets and liabilities, a juridical person, a business unit under a single management, and much more besides.

As part of the mechanisms which govern and control the behaviors and the social life, the dynamic between government agencies and companies represents an important power area, where relevant decisions have been making across the decades which impact significantly the entire society (HALL & TAYLOR, 2003).

Later on, others authors inspired by North (1990) came up with the version of it as it is seen today. Institutionalism rests upon the three pillars of regulative, normative, and cultural-cognitive prescriptions and expectations (Scott, 2008). The pillars can range from those that are more explicit to those requiring less tangible guidance for a firm to conform; or from more rational to more unconscious behavioral choices. The formal rules are the tangible regulations set by a society and that it expects its surroundings to abide. The informal are the intangible

rules set by the same society such as taboos, tradition, and such. Hence, there are two types of norms that one must conform to such as to function within a society and environment. These two will also later be the building blocks in much of the literature on legitimacy although adapted to the new frameworks. The third Institutionalism pillar called Cultural and Cognitive is about the taken-for-granted, it is the deeper point of the social rules, what is the most tough to be changed. The cultural-cognitive pillar refers to processes of making sense of social reality and creating shared understanding of this reality. The processes encompass the social construction of reality whereby symbols, words and actions are interpreted and made sense of to such a degree that they become consolidated. Such cultural-cognitive pillars are essential for the conception of our social identity and how we adapt to cultural belief systems and cultural frames on a macro level (HINDRIKS & GUALA, 2015); (HALL & TAYLOR, 2003) and (DIMAGGIO & POWELL, 1983).

From now on, the concept of informality blows up which has been coming from the political science, co-relating state, society, companies and their citizens and employees across the globe. A large set of authors and research such as Börocz (2000), Knowles & Weatherston, (2006); Acemoglu, Johson & Robsion (2001); Rodrik, Subramanian & Trebbi (2004) and Olson & Hibbs (2005) pointe out how the informality rules have been modelling the institutional process already established on the regular basis. These analyses identified that informality dynamics impact the companies and states on different cross-countries.

On the other hand, companies have been investing a large amount of working hours and budgets reinventing themselves to reduce the employee´s turnover rates, improving their workplaces.

Indeed, there are two key elements on the People Management Strategies that measure and provide a robust data to support companies to move it forward. Engagement and Entrenchments companies' rating levels have been introduced since the last decades and have been part of the business agendas. (BAKKER & DEMEROUTI, 2009); (COCKSHAW & SHOCHET, 2014) ; (KANTER, 1968); (SCHEIBLE & BASTOS, 2014) and (RODRIGUES & BASTOS, 2010). On the both sides, while engagement rate in general terms analyzes the employee´s sense of belongings which is totally correlated to the emotional interactions (FARNDALE & MURRER, 2015); (ROWE & BASTOS, 2007) and (ROBBINS, 2005); entrenchment rate completes the better organizational shape confronting the employee´s emotional relationship with the their rational decisions in terms of how tied the employees are feeling, considering their internal efforts and external opportunities to remain working at the same company (ELDOR & HARPAZ, 2015); (RODRIGUES A. C., 2009); (RODRIGUES & BASTOS, 2011) and (SCHAUFELI & BAKKER, 2004).

There is much correlated research, as referenced earlier, with data and research conducted by the top five People Management Consulting Company, that point out almost 1 in 3 employees do not trust their employers. In parallel, more than 600 US businesses with 50-500 employees, 63.3% of companies say retaining employees is harder than hiring them. Roughly from 100K to 200K quit their job every day due to low level of engagement. It impacts the P&L negatively in US$ 2.9M per day in US, looking for replacement workers (JOUANY & MÃKIPÃÃ, 2021). Companies with Highly Engaged Workforce are 21% More Profitable Employee engagement isn't just about soft, intangible, and feelings-based reviews about employee well-being. Employee engagement has a very real impact on business success, and employee engagement should be considered a part of a business strategy. Due to Soreson (2013) into the Gallup's

meta-analysis, the business or work units that scored the highest on employee engagement showed 21 percent higher levels of profitability than units in the lowest quartile. Companies with highly engaged workforce also scored 17 percent higher on productivity. Successful organizations focus on employee engagement by ensuring all employees have the best knowledge and tools available to perform their jobs as well as possible.

1.2. PROBLEM AND RESEARCH QUESTION

This new thesis approach addresses the problem which resides in the multinational companies that operate across the globe in different geographies where there are institutional dynamics variances. As prior discussed, when institutionalism assumes a key player to forge the people interactions, the informality rules blow up, which determines the informal institutional environment, generating social-cognitive regulatory fields with their own rules and processes that impact the people´s sense of belongings.

From the theoretical standpoint, there are contributions that come from where it analyses the question of whether geographies or institutions is the most deep determinant of economic development, considering that informality rules are modelled as a deep determinant rather than the formal processes already stablished on the regular basis .

On the other hand, from a practical standpoint, it is expected an overcoming of multilevel movements from the micro to macro management processes, especially on the informality dynamics on different approaches cross-countries. From the procedure’s standpoint, constructs

and their relationships will be measured using the methodological processes identified as the Appendix C.

This thesis background relies on operating a business day by day. Annually the company where the author researcher works run an annual engagement survey which is standardized by 12 questions without considering the local and countries nuances. Despite having the results break down location by location, the analysis conduct generalizes the main results which impacts significantly the People Management approaches. More than 18 countries and 19.000 employees are involved in these processes, working in their home countries, or working across the regions.

Indeed, the research problem would be announced as such: what is the impact of informality rules on the organizational engagement processes in the global company and their cross-country variances?

In this thesis the phenomena were examined following 2 of the 6 cultural dimensions of Hofstede (2003) previously described, which allowed the first insights that defined the final approach where the phenomena were discussed under 2 of the 9 cultural dimensions of the globe leadership project. As there is no informality database available, culture dimensions will be used as a proxy, considering that this constructs measures the people interactions on defining rules, processes and procedures as based on their own values and beliefs.

It is inferred in this investigation, and by its analysis method, that the way that people interactions are modified, from the bottom-up construction perspective, are primary impacted by the informality rules, and that it is possible to measure engagement and their correlations at the organizational levels once these two contractors identify people´s emotions and rational decisions, considering sense of belongings and organizational tie.

Not all other cultural dimensions will be considered under the primary delimitation model on the research design for this thesis arguments, once they are not inferred to be based on the people's interactions, therefore, they could have a strong impact on the results if, on a different time, or on other scenarios, the null hypothesis could be refuted, nonetheless, all the results for this research will be fully presented as Appendices.

To build possible answers to the thesis' main problem, the approach is an exploratory design, using quantitative data available for the research, since the sources are real data used on the organization operations there is limitations on sampling and other experimental approaches. The two main groups of data will define the way to address the thesis main problem, the first data group have individual answer granularity, which means that each tuple of data will represent a unique answer to one questionnaire, the second group of data have country aggregated granularity, which means each tuple represent the characteristics of each country, or an aggregated total for each country.

The sampling will be restricted to one organization, which will be outlined in the present research as the data source is queried from a database that is used by the organization data

visualization tool. The organization operates globally, with a large set of facilities located in different countries, this way different countries and its relations could be analyzed within the same organization, reducing biases from interferences that come from non-standardized People Management practices cross-countries.

Before running the research, the overall approach was reviewed. On top of assuming the relevance of the Organizational entrenchment which defines the employees needs to stay in the organization (RODRIGUES A. C., 2009), there are additional latent variables to be measure (ASP – Adjustment to Social Position; IBA -Impersonal Bureaucratic Arrangements and LA-Limited Alternatives). Then, the hypothesis were reprioritized on analyzing the impact of the informality rules on the engagement organizational process, measuring the emotional relationship between employees and companies (BASTOS, 2014). The rational relationship dimension (entrenchment) will be addressed in a separate research (BOURNE & JENKIS, 2013).

Finally, this thesis is composed of 5 sections, plus Index, Appendices and References. In addition to the introduction, section 2: Theoretical Background will describe the key constructs such as: Institutions, Informality, and Engagement which covers the theme. Then section 3: Methods will summarize the methods to be used which includes research design, limitations, and its procedures. On section 4: Results and Discussions the results from the method described in the previous session will be presented and discussed afterwards. The thesis end with Section 5: Final Remarks summing all partial results previously discussed to move forward an answer to the thesis main research problem, which is to better understand the impact of the different informality rules on the organizational engagement processes.

2 - THEORICAL BACKGROUND

2.1. INSTITUTIONS DIMENSIONS

Institutions depend on people interactions and beliefs shared that redefine rules in order to reestablish (SCOTT, 1995) and (DIMAGGIO & POWELL, 1983) . Thereby, All institutions theory discussed with the various researches resides the idea that systems of rules should be created, modified and updated by the people interaction. (NELSON & WINTER, 1982) Indeed, As part of the mechanisms which govern and control the behaviors and the social life, the dynamic between companies and their leadership represent an important power area, where relevant decisions have been making across the decades which impact significantly the entire society (HALL & TAYLOR, 2003).

Reinforced by Scott (1995), the current stage believes that collectivity influences over particularities. Hence, Organizations are treated as significant units and a relevant part of the social universe. On the one hand, Organizations, particularly in view of the breadth of social institutions, are perceived as potential links between individuals and the social world. It is in the irrationality of the formal structure itself, without neglecting informal interactions, one of the main contributions of DiMaggio (1994) and Scott (1995), in comparison with the explanations of the new institutionalism while the old institutionalism presented the inconsistency between the organizational reality and the formal explanations in the informal interactions themselves. On the other hand, criticized by the functionalism, there is a common conscious stuck on the decision maker based on the previously experiences and values / beliefs that be presented in the micro level approaches during the negotiation between the social

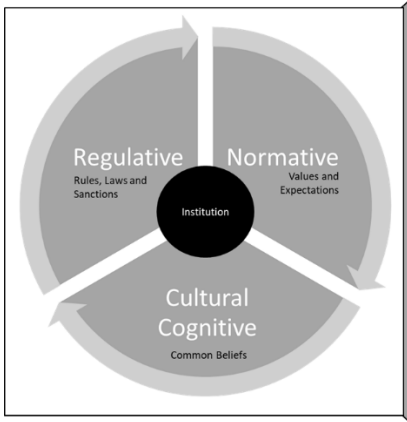

agencies that are been representing in that case by the sector agencies an companies (BOURDIEU, 2001).

2.1.1 . INSTITUTIONAL ENVIRONMENT

Many theories and frameworks described and reviewed institutionalism with a struggle focus on business performance and business approachability. North (1990), with his view on formal rules and informal constraints on institutions, was one of the first researchers that addressed legitimation. Later, other authors inspired by North (1990) came up with the version of it as it is seen today. Institutionalism rests upon the three pillars of regulative, normative, and cultural-cognitive prescriptions and expectations (Scott, 2008). The pillars can range from those that are more explicit to those requiring less tangible guidance for a firm to conform; or from more rational to more unconscious behavioral choices. The formal rules are the tangible regulations set by a society that it expects its surroundings to abide. The informal are the intangible rules set by the same society such as taboos, tradition and such. Hence, there are two types of norms that one must conform to such as to function within a society and environment. These two will also later be the building blocks in much of the literature on legitimacy although adapted to the new frameworks. As presented in Figure 01, the institution Environment is compounded by three pillars: Regulative, Normative and Cultural-Cognitive Pillar.

As discussed by Vázquez-Salceda (2004) and complemented by Scottt (2008), the Regulative Pillar is the one where the rules, laws and sanctions reside. Regulative processes involve rule setting within the organization and how it is conformed to. The rules may be formal like those set by the law, or less formal as set by some informal mechanisms like norms and values.

FIGURE 1 - Three Pillars of Institution

Items / Pillars	Regulative Pillar	Normative Pillar	Cultural-Cognitive Pillar
Basis of compliance	Expedience	Social Obligation	Taken-for-grantedness
Mechanisms	coercive	Normative	Mimetic
Elements	Rules, laws, sanctions	Values and expectations	Common Beliefs
Basis of legitimacy	Legally sanctioned	Morally governed	Comprehensible Recognizable
Routines	Protocols Strandards	Jobs, Roles, Obedience to duty	Scripts

Source: author, adapted by Scott (2008) and Vázquez-Salceda (2004)

The regulative pressure in family businesses relates mainly to the governance structure. The second pillar is called Normative Pillar which covers social obligation, addressing the values and the society expectations. Normative processes include norms and values and thereby desirable acts and appropriate ways to behave according to expectations. These expectations can be either role or goal defined or may be defined by social obligations and morally governed. The third and last pillar called Cultural and Cognitive is about the taken-for-granted, it is the deeper point of the social rules, what is the most tough to be changed. The cultural-cognitive pillar refers to processes of making sense of social reality and creating shared understanding of this reality.

The processes encompass the social construction of reality whereby symbols, words and actions are interpreted and made sense of to such a degree that they become consolidated. Such cultural-

cognitive pillars are essential for the conception of our social identity and how we adapt to cultural belief systems and cultural frames on a macro level.

Normative processes include norms and values and thereby desirable acts and appropriate ways to behave according to expectations. These expectations can be either role or goal defined or may be defined by social obligations and morally governed. The third and last pillar called Cultural and Cognitive is about the taken-for-granted, it is the deeper point of the social rules, what is the most tough to be changed. The cultural-cognitive pillar refers to processes of making sense of social reality and creating shared understanding of this reality. The processes encompass the social construction of reality whereby symbols, words and actions are interpreted and made sense of to such a degree that they become consolidated. Such cultural-cognitive pillars are essential for the conception of our social identity and how we adapt to cultural belief systems and cultural frames on a macro level.

Understanding the three pillars of institutions is the way society addressed how the institutions forged their boundaries based on their previous experiences and how they are projecting their futures. This balance and calibration between the pillars contributes significantly to the rules re-establish the equilibrium designing the new order and reorganizing the institutions previous defined.

2.1.2. INSTITUTIONS UNDER THE ECONOMICS AND SOCIOLOGY PERSPECTIVE

Institution is a term often used to determine mechanisms such as what governs the behavior of a set of collective interactions within a community delimited by well-defined horizons. As mentioned by Hindriks and Guala (2015), institutions are ubiquitous. Even a simple description of who human beings are or what they do would be very difficult if they couldn't use institutional terms. As our behavior is constantly influenced by institutional entities and roles, institutions have always been a central topic of research in the social sciences. But institutions are also called philosophical for several reasons. Institutions are peculiar products of human activities, and they can hold the key to understanding our special place in the natural world. This is why human beings are the only animals that can build many special social places in the natural world. This evidence supports the perspective of science that humans are unique in building diverse social organizations and that they constantly invent new ways of living together.

From a historical point of view, institutionalism emerged at the beginning of the 20th century in line with the approach to the analysis of political systems and forms of government in which the social sciences, in particular, political science, began to devote its studies. Such approaches sought to differentiate and qualify governments, with studies based on descriptive and historical analysis, creating an environment of vast criticism, which is most often related to theoretical and methodological weaknesses as mentioned by Romero (1999). Powell and DiMaggio (1991) contributed in this context from the perspective of calling it old institutionalism. Due to its historical description, classical institutionalism was considered a perspective without theory, as it did not allow for comparisons and generalizations. This gap is filled as the social sciences

undertake to develop a behavioral approach, with emphasis on the theory of rational choice and sociological institutionalism, with its resurgence in the 1960s and 1970s. All three versions of institutionalism will be discussed in this essay throughout the next few chapters. Even so, it was in the 1980s and 1990s that the analysis of institutional configurations was intensified, as the importance of the role of institutions in the development and coordination of actions that needed mutual cooperation was highlighted.

As considered, Institutionalism assigns to the institutions the role of regulatory mechanism for the functioning of society, contributes Hogdson (2011). Institutionalists tend to describe institutions as a government action in the field of organizational science. They are the institutions, agents and rational actors to achieve their specific objectives, where cooperation, complement Nelson and Winter (1982), is sustained through mechanisms that interact with their own replication threats together with the ability to transmit information flows and its means of monitoring. Institutions for North (1990) are the focal points for cooperation, even though they coexist with a strong relationship of conflict and power given a certain scenario in the political sphere based on institutional change.

In this scenario, Commons (1924) begins considering that the institutions timeline is an imperfect solution to past conflicts. This point will be deepened throughout this essay when Historical Institutionalism is approached in its breadth and presented its basic characteristics. Even so, complements Commons (1924) that the creation and maintenance of institutions can test the stability and balance of the system, even though, in scenarios of multiple equilibrium, institutions play a considerable role as an independent agency, reiterates Hogdson (2011). For

most institutionalists, institutions themselves are designed to deliver the own profits under their absolute formats and boundaries.

Believing that Institutions depend on people's interactions and shared beliefs that redefine the rules to restore order, as mentioned by Feldman and Pentland (2003), the transaction within the system becomes an important actor that improves or reduces complexity. Thus, North (1990) made a significant contribution, stating that when there is substantial investment in terms of cost, transactions are important. Neither North and most of his followers explore how property rights and other institutions come about. Throughout most of history and across much of the world today, institutions have not provided the reliable commitment needed to develop low-cost transactions in capital and other markets. Therefore, there is little evidence to support the view (apparently and implicitly held by many economists dealing with the key economies of Central and Eastern Europe) that the necessary institutions will be the automatic result of getting prices right through the elimination of price controls themselves and exchange.

In fact, under the theory of all institutions discussed with the various research, lies the idea that systems of rules must be created, modified and updated by the interaction of people, as mentioned by Nelson and Winter (1982), where they define that the institutions are a structured system of embedded social rules. Social rules presuppose those interactions regulated by laws of standards defined by society, firms or corporations. In the early nineteenth century, Brown (1905) already defined that the corporation is a legal subject of rights and duties, Hodgson (2015) reinforces that companies in the transaction cost economy are clearly legal entities. Machlup (1967) argued differently. He listed no fewer than ten company concepts employed in

business and economics literature and suggested that the company had been considered an organization, a decision-making system, a collection of assets and liabilities, a legal person, a business unit under a single management.

The institutional approach analyzes the divergence of state power capacities over institutions, says Hogdson (2011). It is in institutional theory, the creation of new institutions that are able to eliminate transaction costs, complements North (1990), as it takes a competitive advantage against the vulnerability of others. The States, on the other hand, create institutions with the objective of solving problems of a collective order, reducing such transaction costs, incentives to corruption, promoting the flow and exchange of information, anticipating future threats and distributing capabilities more effectively and equality.

Peters (1999) adds to the institutionalism´s context, the power variable as a central element to collective action processes that have implications for the development of institutional theory itself. This theory is presented under different perspectives that use the institution as a unit in order to analyze the political-economic reality.

Many theories and frameworks have described and revised institutionalism with a struggling focus on business performance and affordability. North (1990), with his view of formal rules and informal restrictions on institutions, was one of the first researchers to address legitimation. Later on, other authors inspired by North (1990) created the version as it has been seen today. Institutionalism rests on the three pillars of regulatory, normative and cultural-cognitive prescriptions and expectations adds Scott (2008). The pillars can range from those that are more

explicit to those that require less tangible guidelines for a company to conform; or from more rational to more unconscious behavioral choices. Formal rules are the tangible regulations established by a society that it expects its surroundings to comply with. Informal are the intangible rules established by the same society, such as taboos, tradition, and others. Therefore, there are two types of norms that we must obey to function within a society and the environment. These two will also later be the foundations of much of the literature on legitimacy, albeit adapted to the new frameworks. As shown previously in Figure 01, the Institutional Environment is composed of three pillars: Regulatory, Normative and Cultural-Cognitive Pillar.

As discussed by Vázquez-Salceda (2004) and complemented by Scottt (2008), the Regulatory Pillar is the one in which rules, laws and sanctions reside. Regulatory processes involve defining rules within the organization and how it complies. Rules can be formal as established by law or less formal as defined by some informal mechanisms such as value systems. Regulatory pressure on family businesses is mainly related to the governance structure. The second pillar is called the Normative Pillar, which covers social obligation, meeting society's values and expectations. Normative processes include norms and values and therefore desirable acts and appropriate ways of behaving in accordance with expectations. These expectations can be defined as a function or goal, or they can be defined by social and morally governed obligations. The third and last pillar, called Cultural and Cognitive, deals with the acquired fact, it is the deepest point of social rules, the most difficult to change. The cultural-cognitive pillar refers to processes for making sense of social reality and creating a shared understanding of that reality. The processes encompass the social construction of reality, in which symbols, words and actions are interpreted and understood to such an extent that they are consolidated. Such

cultural-cognitive pillars are essential to the conception of our social identity and how we adapt to belief systems and cultural structures at a macro level.

Understanding the three pillars of institutions was the way in which society approached how institutions forged their boundaries based on their past experiences and how they are projecting their futures. This balance and calibration between the pillars significantly contribute to the rules reestablishing the balance, projecting the new order and reorganizing the institutions defined previously.

Referring to the institution concepts, there are essentially two approaches that centralize these intuitions and their variations. One of them characterizes the social structures that restrict human interaction. As mentioned earlier by North (1990), institutions are defined as a field in society delimited by the actions of its components that design its rules and systems. The other view is more comprehensive where institutions leave their systems interacting all the time with the value chain and its stakeholders where all actors develop within this system to obtain better results. Commons (1924) reinforces that collective actions where institutions are created and controlled, remove barriers, and expand human actions, above all, are facilitators to support and help those firms and corporations to compete and a higher operational level.

In the way, the role that the institutional environment was observed as the role where defines the structure and behavior of organizations themselves, as mentioned by Meyer and Scott (1992). DiMaggio and Powell (1983), Scott and Meyer (1983) and Zucker (1977) reiterate the

direct correlation between organizations and institutional environments and how these environments have a significant influence on the way organizations are structured.

The entire process of institutionalizing beliefs and values in the light of normalization and cognition takes place at various levels of institutional analysis. Regarding DiMaggio (1988) and Powell (1991), this process occurs at interpersonal and intra-organizational levels based on institutional elements and arguments that respond to agency issues in organizational studies. On the other hand, for Scott and Meyer (1994), it is in the social and cultural influences, the amplitude that affects organizational life and the political and ideological aspects of social life. It is here based on rationalization (scientific, cultural and ideological), the expansion of possibilities in the needs of organizations to expand and transform themselves.

Scott (1992) argues that institutionalism is the system of beliefs and norms that promote the conditions in which organizations arise and where their structures and activities are developed. Its formatting is related to the nature in which belief systems, norms and meanings coexist in the institutional environment. Such evidence is present in the regulations (norms and beliefs) that limit the action of organizations in each area of their respective professional activity. Thus, Scott (1992) adds that the link between organizations and their environments have acquired great importance in organizational studies as opposed to purely technical explanations, especially when it comes to organizational structure and human behavior. Even though there is a convergence regarding the importance of the environment, there is little resonance about how the environment should be conceived and what its most relevant characteristics should be.

The institutionalist paradigm of a rational order is based on the extensive conflicting relationships of individuals, even though the market is a major agent under the aspect of the formal institution of economic and social regulation to mitigate failures and limitations of the system itself (HODGSON, 2015). In this concept Parsons (1982) finds resonance as he describes the theory of action and the hierarchy of control under the aspect of regulation. Such relationships will be addressed throughout this essay from the perspective of institutional theory.

Even so, from the perspective of institutionalism and its economic aspect, Machlup (1967) addresses the existence of the rationality of individuals where there is an intention to generate benefits in the course of action to be taken. The rational discourse will find reverberations in the supposed self-interests and altruism of the actors. Institutional changes, describe Nelson and Winter (1982) will be analyzed in the decision maker's view and in the cost-benefit relation in a given society. This classical theory of rationality assumes, in this context, that all actors have complete information in their decision-making processes. Thus, institutional forces are alternative sources of conflict generation, even though it is recognized that institutional processes overlap with rational measures of rule-setting.

Summarizing, that the institutional approach can be found and divided by old and new institutionalism. Throughout its trajectory, it has been explored in different aspects: political, economic, and sociological, which offer vast subsidies for the understanding of social phenomena in their respective fields of knowledge. The political aspect stands out for its approach from legal and governance structures to the analysis of the autonomy of political institutions in the face of social pressures. The economic approach, on the other hand,

introduces the social structure as a key point in the decisions of economic processes. Finally, the sociological aspect presents the relationships between environment and organizations centered on informal interactions tensioned by power relations in the constitution of organizations.

2.1.3 . NEO-INSTITUTIONALISM - THREE DIFFERENT METHODS OF ANALYSIS

Regarding Hall and Taylor (2003), the term “new institutionalism” comes into force with greater intensity in the sphere of Political Science. Even so, the new institutionalism is ambiguous insofar as it does not constitute a solid and unified cylinder of thought. Such evidence is presented in the three different analytical approaches that are called by themselves as new institutionalism. These three approaches will be discussed here as: Historical Institutionalism, Rational Choice Institutionalism and Sociological Institutionalism. Thus, the term “neo-institutionalism” or new institutionalism was the subject of much controversy and criticism, as there was a certain misunderstanding in the use and application of this term since there were standard procedures. However, much of this miscomprehension is directly related to its application which disappears when supposing that there is no pattern current of thought and instead there are at least the three different methods of analysis that emerged in the 1980s, as mentioned above.

The new institutionalism which is composed in 3 types: historical, sociological and rational choice approaches, emerges at the beginning of the last decade as a set of rules to determine institutional reform processes based on incentives and restrictions imposed by the behavior of

different economic agents and actors, social and political in the design and implementation processes of the public policies to be measured in relation to economic growth and development.

TABLE 1 - Neo – institutionalism approaches

Neo – Institutionalism Approaches	Main Characteristics
Historical Institutionalism (considers that Political and Economic Institutions forge behaviors)	• Broad vision around the institutional relationships and people behaviors • Power symmetry associated to the institution´s operations • Institutional Development – symbioses between pathway and consequences • Additional external elements (ideias) contribute to the political results • Deductive approach • Institutions – procedures, formal rules and guidelines
Rational Choice Institutionalism (Institutional Organizations as the key pillar to manage their own resources)	• Coercive and restrictive action • Rationality approaches (focus on one way) • Politics as a series of dilemmas of collective action and not of power struggle • • Influence of behavioral aspects on sets of preferences • • Inductive approach • • Institutions - formal and informal protocols related to the environment
Sociological Institutionalism (Institutional Procedures defined as the cultural deployment process)	• Institutions beyond to the formal rules (symbols, moral routines and behaviors model) • Institutional Practices Genesis – social life improvement despite of getting better results (efficiency) • Inductive Approach

Source: author based on (HALL & TAYLOR, 2003)

This importance of new institutional trends is reinforced by March and Olsen (1989) where the institutions by themselves have been handling the individual´s preferences and their relationships under the arena where these predilections are presented. On the way, Scott (2008) corroborates considering that role of values as central point from the old institutionalism to the new institutionalism in guiding cognitive processes. This new institutionalism relativizes instrumental rationality and understands that institutions are driving and stabilizing forces. The

new institutionalism is based on methodological individualism where all the results of human actions will be explained by the individual action which the institutions themselves legitimate (OLIVER, 1991). Neo-institutionalism is expressed under two major focus: in the selection of governance structures of private actors in a given economic environment and in institutional change itself under the performance of different environments.

From now on, new lines of interpretation arise, modifying concept of organizations in opposite to the social theory previous approach. Institutions will be a constructed social phenomenon, the product of intentional and planned interactions. Meyer and Rowan (1977) complement this context by interpreting organizations from the perspective of objective nature and non-rational social processes and will be complemented by Powell and DiMaggio (1991), adding the script as a model to be followed rather than a choice voluntary, motivational and on purpose.

The three new institutionalism types of thoughts will be discussed: historical, rational choice and sociological where the main characteristics will be presented break down in the following pillars: their inside out relationship, the impacts on forging the individual´s behaviors, their powers and the development institutional´ s journey. These elements are shown in Table 1 based on the neo-institutionalism approaches.

2.2. THE INFOMALITY RULES MEASUREMENT APPROACH

Most of the time, informality is a concept which has been coming from political life for so many years. It is a widespread co-related to the state – society and companies across the globe. Misappropriation of the public assets and funds are identified as one the most relevant key drivers that blow up the informality rules cross-counties across the globe (BÖROCZ, 2000).

The research has been growing in the last decades which analyses whether informality rules and their geographies impact business management at the states or companies levels. The Cross-country data has been useful to reveal how these informalities influence on the labor relations comparing international companies and their operations in different countries across the globe (KNOWLES & WEATHERSTON, 2006).

The empirical proxies used for institutions in the literatures and researchers available have been moving from on then formal institutions only to informal institutions also. The informality rules measurement was included in this thesis as a concept that urges closely to the social capital and culture norms, in a representative framework as discussed by BÖROCZ (2000) and KNOWLES & WEATHERSTON (2006).

The following items explore how culture should be a better proxy to measure informality rules in a global perspective and how it would impact people management.

2.2.1. INSTITUTIONS AND CULTURAL FORCES

Regarding those institutions' concepts, institutionalism resides in the central idea of the pillars that combine rules and laws; values and expectations; and taken-for-granted. Indeed, institutions is a term frequently used to determine such as mechanisms which govern the behavior of a set of collective interactions within a community delimitated in a boundaries well defined. As mentioned by Hindriks and Guala (2015), Institutions are ubiquitous. Even a simple description of who human beings are or what they do would be very difficult if they could not use institutional terms. Since our behavior is constantly influenced by institutional entities and institutional roles, institutions have always been a central topic of research in the social sciences.

As considered that the main pillar of the institutions is forged under the system of rules constantly reorganized to redefine their equilibrium, understand the dimension of the dynamic capabilities in the current and future business agenda become relevant to the administration sciences and future researchers. During the literature review, it was possible to identify such points where the dynamic capabilities are the basis of reorganizing the equilibrium where the institutions were defined.. It considers the determinants of the existence of a new equilibrium where the boundaries are no clearly defined in the new business agendas with new globalization concepts in such new order where world becomes increasingly volatile, uncertainty, ambiguous and complex.

There are a large list of points and counterpoints, suggesting that institutional theory needs refocusing in terms of approachability where new systems, symbols and behaviors must be incorporated to the frameworks originally designed, There is a common trend where the sociological and organizational approaches in order to understand institutions believe that

institutions shape organizations to prioritize the collective efforts (GREENWOOD, HININGS, & WHETTEN, 2014). On the other hand, Meyer (1993) adds relevant arguments to this relevant dialogue where organization is defined as a whole structure where collective effort could be achieved, and collective purposes accomplished.

The organization understanding shaped by institutions could be classified as social mechanism for achieving collective ends. In a different lens, Scott (2008) argues the institutional shaping is a social phenomenon where collective preferences rest under the institutional boundaries. Indeed, institutional contexts and processes influence how new organizational clusters arise under the new architecture patterns.

Although our concern is similar to this desire to understand how institutional contexts and processes influence how new organizational forms arise, and the archetypal parameters of those forms, we go a step further. For us, it is important to understand not only the emergence of new organizations, but also existing, more mature organizational forms in their multiple guises (GREENWOOD, HININGS, & WHETTEN, 2014).

Those organizational mindsets are the beliefs and attitudes that drive their members into a collective understanding regarding norms and standards to forge the employee´s behaviors that must be required and acceptable by the companies. In general terms, values are considered as the essential component of organizational culture (BOURNE & JENKIS, 2013). According to Schein (1985) corporate values are collective beliefs about what the entire enterprise stands for, takes pride in and holds intrinsic worth. It sets the tone of the environment, bonds people together, facilitates work behavior and achievement of shared goals. It also represents the

ambitions that people hold for the organization as a living system because values define who and what each person has to offer as a human being to the overall enterprise (MIRABLE, 1986).

As mentioned by Drucker (2000), Culture Eats Strategy for Breakfast. It means that management culture and organizational values consequently are relevant to preserve the company´s long term businesses. There is an academic trend to conceive values as unitary, fully formed and stable entities. However, uncovers differences indicating that organizational values adopt a number of forms (BANSAL, 2003). Stepping back those concepts, Parson (1990) is invited to the dialogue where his theory of the social system were designed from the ground up, considering the hierarchy control across the society which forges the individual´s behaviors to satisfy the entire system, taking place at the same model under the company´s environment.

Culture change occurs when messages change, and these messages come from three sources: systems, symbols, and behaviors (TAYLOR C. , 2005). On the systems perspective, rewards, punishments, taxes, refunds – in general, whatever are measured – systemically influence the culture. Symbols reinforce the culture behind the systems and at the end, people react on the same direction presented into the first two pillars as fundamental beliefs and assumptions, thus values guide individual behavior and judgments across such situations (ROKEACH, 1973)

2.2.2. CULTURE AS THE INSTITUTINALISM PROXY

There is a large list where culture is defined around the academic and business articles across the globe. A really great example was published by Deshpande and Webster (1989) where a hundred definitions were listed and analyzed, conveying a common sense about culture. As much as the research was conducted, culture was defined as history tale, ideas, product, behaviors, and models, based on symbols which is a behavioral abstract. The criteria is amplified by Taylor (2005), creating the framework where culture is shaped by three pillars: behaviors, systems and symbols.

Culture is a relevant construct presented frequently on the scientific research and business agendas under defining how the human behaviors spread up in the social context where the agencies are included. Those contexts bring to the discussion critical dilemmas where their group member have been facing on presenting itself through beliefs, which by their instead, they are translated into actions of their own behaviors (CASAGRANDE & MACHADO, 2016).

Culture change occurs when messages change, and these messages come from three sources. Regarding the first pillar called System, changes will occur when rewards, punishments, taxes and refunds reflect the right message sent. However, it is not enough. The Systems designed must be aligned with the Symbols where decisions will have meaningful, promoting and prioritizing the agenda on the right direction. Then, people will respond to these formal and informal incentives with the right behaviors (TAYLOR C. , 2005).

Combining the findings listed in this research, the culture dimensions and boundaries should be identified and how it impacts the entire value chain. The first impact is related to the product per se as mentioned by Deshpande and Webster (1989) and Taylor (2005). It is the critical and tangible element which represents the company in front of its customers. The second impact talks about plurality. Companies are shaped by different layers and different people that bring to the organization their previous experience and bias. Company´s history is the third pillar, as the same as people bring to the company their previous experience, companies have their journey where overtook challenges and made changes during their several years of existence. This large list of pillar complicates so much the definitions and how researches could shape culture in a same and common framework (HOFSTEDE G. , 1980).

One of the most well-known researcher in that area, Hofstede conducted a large research across the globe under the IBM´s companies and subsidiaries within 64 countries where differences in terms of country´s values were identified. His results defined culture as a mental collective program that distingue people and groups from themselves. Culture is a collective phenomenon which depends the people beliefs shared between a group, living in the same social environment that was learnt and programmed (HOFSTEDE G. , 2003).

Hofstede (2003) adds the culture relativism which will be so relevant for this thesis. Culture relativism is the area where influences people´s judgment and agency´s decision making. Nevertheless, the influence comes from the external and internal environment which means countries, companies and groups that force and forge societal values. These values influence the institutional structure and contribute to its maintenance and development. The societal

values reflect exactly the comments of the institutional structure moving ahead to the stability as much as the agencies shape it. Changes at the national level are due either to external influences or to human nature. National cultural values are reflected in the occupational subcultures that vary in their degrees of integration (GRAY, 1988). It is quite relevant to understand the influence and relationship between social practices and social values that reside on each country culture and its society (ALAS & TUULIK, 2007),

The cultural relativism reinforces that there is no only one absolute criteria where the people interactions activities are judged and they are framed experience by experience, considering each individual acts as an active agency beyond to the observation process. However, the culture expression understanding, Hofstede (2003) recommends that the difference between culture, personality and human nature must be clarified. The visible behaviors derivate from the individual´s personality and the human nature. The GLOBE Project has been identifying the impact of the management system in the countries where the research are usually applied. On an opposite side, contradicting the common sense, analysis of correlation between the 9 cultural values and 6 global leadership dimensions of first leadership layer does not demonstrate relationship. It means that national culture values are antecedent factors which influence leadership expectations (DORFMAN, JAVIDAN, HANGES, & DASMALCHIAN, 2012)

Instigated by this concern that was emerging in the academic world, Hofstede (2001) conducted his research on the dimensions of culture had two objectives: to develop a commonly acceptable, well-defined, and empirically grounded terminology to describe cultures, and to analyze the data collected in a systematic way and over a significant number of cultures, rather than using

only impressions. In light of this study, Hofstede (2003) came to understand that values form a central basis of culture, in which individuals come to prefer a certain state over another. Values became the basis of culture through socialization in which they are developed and explain the existing similarities and differences between individuals, groups, nations, and cultures.

Additionally, these dialogues and discussions bring up to the surface other values' approaches that cover the culture´s boundaries such us: materialism and post-materialism; individualism and collectivism instead of capturing large dimensions around values considered as relevant to the society. As part of the Schwartz´s analysis, 56 cultural values were identified that play the role of understanding much better the differences between countries, companies and groups as following: conservatism; harmony; intellectual autonomy; egalitarianism; affective autonomy; hierarchy and mastery (CASTRO, ITOZ, LIMA, & MULLER, 2006).

Culture values absolutely influence the meaning of work by different members at society. In that case, cultural level approach is more appropriate than individual level approach. The appropriate unit of analysis for assessing the validity of culture-level dimensions is the society or cultural group, not the individual person (SMITH & SCHWARTZ, 1997). This finding addresses a large discussion how the cultural level dimension should impact the companies under the employee´s lens where possible impacts of individual differences in value priorities on the meanings and importance that different individuals within a society attribute to work values are discussed (HOFSTEDE G. , 2003).

As part of his early findings and publications in 70, Inglehart started a research program which is considered one of the most relevant studies in the Social Science Areas. The significant amount of works that defend and confirm his main hypotheses, but also the various critics he won over time, are good indicators of the impact of his propositions. Inglehart starts from his theory of human development, postulating that a slow and gradual change in individual value priorities has occurred on a global scale in recent decades ((RIBEIRO, 2007). Thus, the beginning of his research aimed to measure an aspect of cultural changes in 1970, when it was assumed that post-war generations in Western Europe would have different priorities of value from older generations (INGELHART, 2000).

As much as the research moves forward, findings make understanding that the social rules are the ones that forge behaviors. They are not universal and are characterized by local traits reflecting the context where the individuals are included. Social Axioms bring up in order to amplify the occidental articles prevalence and their social values analysis. Recently, researchers pointed out that social axioms are closer to have the human behaviors be representative than values as such as they are transferred locally by messages and day by day symbols by the community members (BOND & YAMAGUCHI, 2002).

As previous discussed so far, most of the researchers such as Inglehart (2000); Hofstede (2003); Schwartz (1999); Bound e Yamaguchi (2002) e Leung et. al (2007 had focused on analyzing behaviors, beliefs and their prevalence between hemispheres and countries in order to better understand the cultural differences under several lens that include agencies, individuals, and social-economic elements.

Within the researches in this area of knowledge are also cultural value theories for Schwartz (1999) that addressed limited aspects of culture (e.g., materialism-post materialism; individualism-collectivism) instead of seeking to capture a wide range of potentially relevant value dimensions. Based on this provocation, Schwartz himself identified a set of 56 cultural values that cover all dimensions of values and explain cultural differences by consolidating them into seven dimensions: a) conservatism; b) intellectual autonomy; c) affective autonomy; d) hierarchy; e) egalitarian commitment; f) mastery; and g) harmony (CASTRO, ITOZ, LIMA, & MULLER, 2006)

The evolution of studies leads to the understanding that social norms are those that dictate behavior. They are not universal and are characterized by local traits, according to the context in which the individual is inserted. The construct "Social Axioms" arises from the discomfort of the Western prevalence in explaining social values. Today, studies show that social axioms are closer to represent human behavior than values, since they are transmitted locally by daily messages and signs among the members of a community (BOND & YAMAGUCHI, 2002).

As seen and discussed so far, and in order to better understand the cultural differences between countries Inglehart (2000); Hofstede (2003); Schwartz (1999); Bond & Yamaguchi (2002) and Leung et. al. (2007) studied the behaviors, beliefs and their predominance among the various countries and hemispheres under the analysis and views of the various social actors and socioeconomic elements that compose the various societies. However, with the intention of giving continuity and contribution to the accomplished studies, arises the analysis of evaluative standards which sought to highlight these differences from the perception of individuals.

For all these reasons, it seems impossible to study the culture construct without addressing social axioms or evaluative cultural patterns that are intrinsically rooted in human behavior that is presented through social norms and specific manners. The evaluative patterns of the constituents of the same culture are the guides of their own behavior, it is the observation of how an individual evaluates the behavior of another that occurs in an intrinsic and natural way without the awareness of such evaluation, always leading to criticism from the observer. As well as the axioms that are the beliefs that will guide the way of thinking, judging and acting (LEUNG, HUANG, KURMAN, NIIT, & NIIT, 2007).

Finally, it is possible to identify that all approaches start from the individual for the consolidation of cultural values as the composition of all its members, making it a new individual in comparison with other countries or other control samples.

2.2.3. HOFSTEDE, GLOBE PROJECT AND THEIR CULTURAL DIMENSIONS

Culture is defined as the collective mental programming of the human mind that distinguishes one group of people from another. This programming influences thought standards that are reflected in the meaning people attribute to various aspects of life and that crystallize in the institutions of a society (HOFSTEDE G. H., 2020). Building on that perspective the GLOBE Project understands that there is only two dimensions unique to the project are performance orientation (degree to which societies emphasize performance and achievement) and humane orientation (extent to which societies places importance on fairness, altruism and caring) (ALAS & TUULIK, 2007); (DORFMAN, JAVIDAN, HANGES, & DASMALCHIAN, 2012); (JAVIDAN & DASTMALCHIAN, Managerial Implications of the GLOBE Project: A study of 62 societies, 2009) and (KOOPMAN, DEN HARTOG, & KONRAD, 1999).

This Hofstede's definition supported the development of the Cultural Dimensions Theory initiated from a survey in over 50 countries from 1967 to 1973. Its intention was to explain internationalization through cultural differences between countries, identifying the organizational culture in each of the countries surveyed and how individuals interpreted their world (ROVAI & PLONSKI, 2014). On the other hand, The Global Leadership and Organizational Behavior Effectiveness Research Program (GLOBE) is a cross-cultural research project in progress since 1993. This multiphase and multimethod research has evolved in which 170 investigators over 60 nations representing all major cultural regions in the world collaborate to examine the inter-relationships between societal culture, organizational culture and organizational leadership (KOOPMAN, DEN HARTOG, & KONRAD, 1999).

Based on his study, Hofstede (2003) came to understand that values from a central basis of culture, in which individuals come to prefer a certain state over another. The values become the basis of culture through socialization, in which they are developed and explain the similarities and differences between individuals, groups, nations, and cultures. All individuals can belong to various cultures, adapting their mental models to each type of culture in which they are inserted. What best explains organizational values are the practices that come from the scale of cultural values (work-related value base) in line with qualitative research and its own analysis to better explain the culture of a company (HOFSTEDE G. , 2003). Aligned with the previous research conducted by Hofstede, the GLOBE Project has differentiated attributes od societal and organizational cultures. The Globe Project addresses how much culture matters, its powerful, latent and unconscious set of forces that determine both individual and collective behaviors and beliefs (ALAS & TUULIK, 2007) and (KOOPMAN, DEN HARTOG, & KONRAD, 1999).

As described earlier, the cultural dimensions defined by Hofstede originated in a survey conducted at IBM and its subsidiaries in different countries. The survey covered 71 countries and was conducted between 1967 and 1973, where 117,000 observations (questionnaires) were obtained. His research on the dimensions of culture had two objectives: to develop a commonly acceptable, well-defined, and empirically grounded terminology for describing cultures; and to analyze the data collected in a systematic way and on a significant number of cultures, rather than just using impressions. The cultural dimensions emerged through multivariable statistics (factor analysis) and theoretical background (Hofstede, 1983,1978). The analysis showed that 50% of the variance in responses across countries could be explained by three factors (individualism and collectivism, power distance, uncertainty avoidance). The fourth dimension

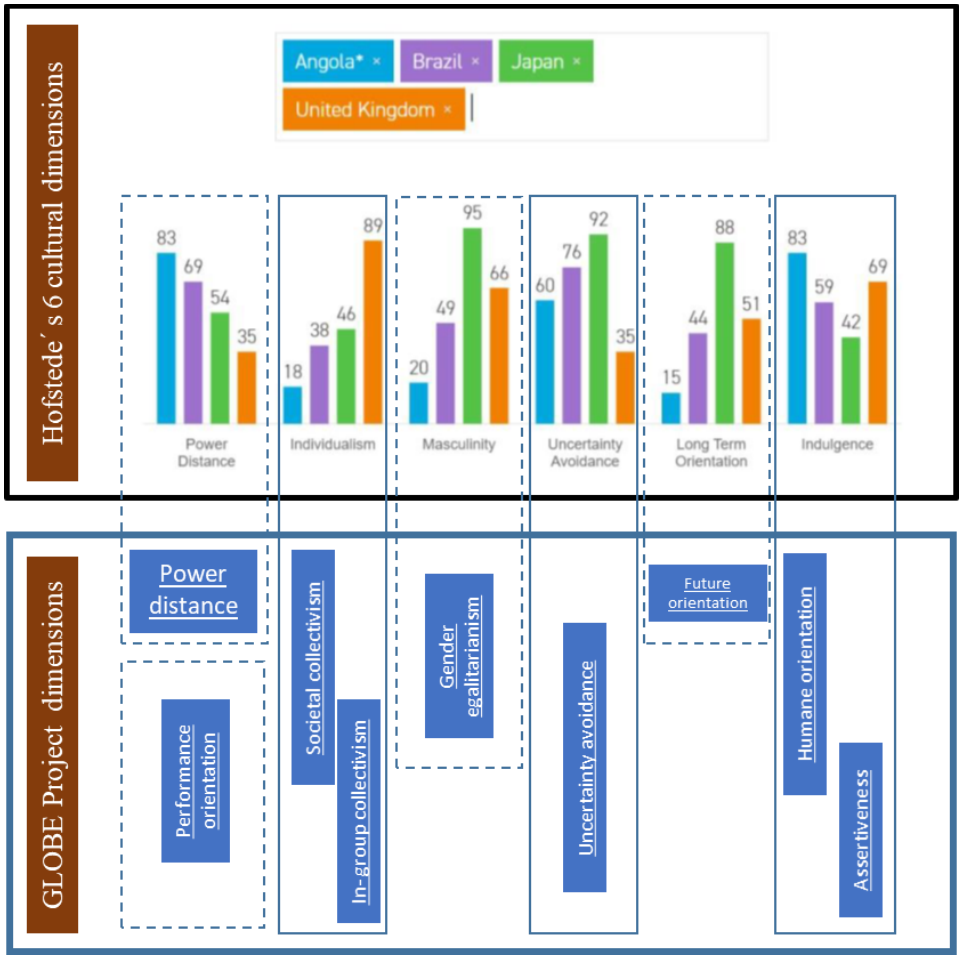

emerged from the research of anthropologists and sociologists and concerns the difference between genders (LACERDA, 2011).

Hofstede's six dimensions defined from his research are: Power Distance, Uncertainly Avoidance, Individualism/Collectivism, Masculinity/Femininity, Indulgence and Long-term Orientation and they can be comparable across countries as an example presented by Figure 2. Contributing to the Hofstede´s previous research, the GLOBE Project defined core cultural dimensions as following: Uncertainty Avoidance, Power Distance, Institutional Collectivism, In-Group Collectivism, Gender Egalitarianism, Assertiveness, Future Orientation, Performance Orientation and Humane Orientation (OLLIER-MALATERRE & FOUCREAULT, 2018). The Globe Project 9 dimensions are also presented by Figure 2 in comparison to the Hofstede´s 6 cultural dimensions.

While that The Hofstede's study shows that the dimensions are independent and are not correlated, although their opposites may be positioned continuously (LACERDA, 2011). The 6 dimensions help to understand the culture of countries and should be taken into account by organizations at all times when accessing their markets and their products, providing proximal comparability between countries against the same six dimensions (ROVAI & PLONSKI, 2014). The GLOBE model was designed to be a fully integrated theory considering the better link between culture, leadership, and organizational effectiveness. Despite of having the national culture aspects of leadership and organizational processes, the model asserts that culture has a sustained influence on societal human welfare and the economic success of the own culture

(ALAS & TUULIK, 2007); (DORFMAN, JAVIDAN, HANGES, & DASMALCHIAN, 2012) and (HOUSE, DORFMAN, JAVIDAN, HANGES, & LUQUE, 2013).

FIGURE 2 – Hofstede´s Country Comparison Tool and GLOBE Cultural Dimensions

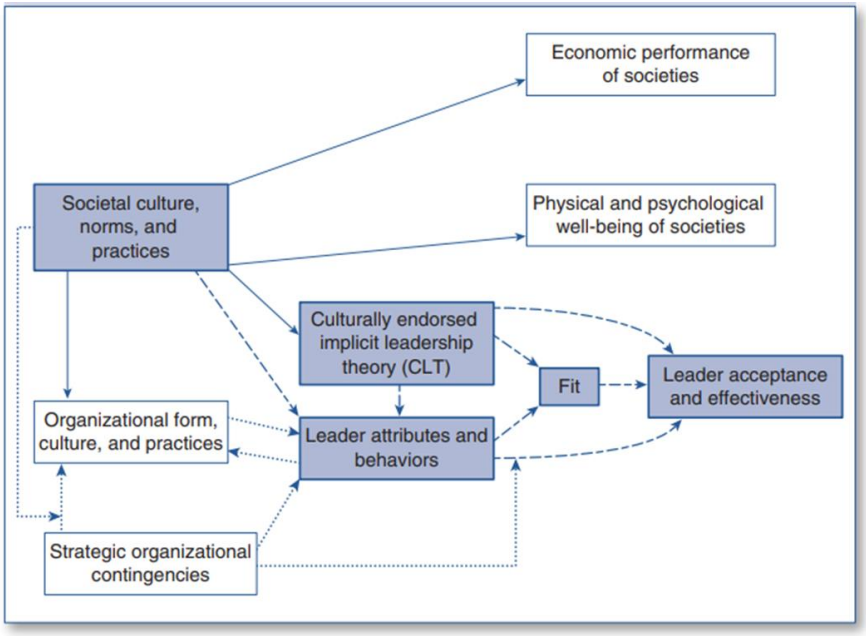

Source: author adapted from (HOFSTEDE G. H., https://www.hofstede-insights.com/, 2020); and (HOUSE, DORFMAN, JAVIDAN, HANGES, & LUQUE, 2013); https://www.globeproject.com/.

Even thought, some coincidences are shown in the Figure 02, comparing the cultural dimensions (Hofstede and GLOBE Project), the main proposition of the GLOBE´s research distinguishes the attributes and characteristics that separate societal culture from each other may

also suggest organizational practices and leader attributes/behaviors that would be frequently enacted and effective in that culture. Societal practice and value practices are the basis of the test where the culture proxy resides as part of the informal rules drive the social regulatory framework as present by the FIGURE 03 (DORFMAN, JAVIDAN, HANGES, & DASMALCHIAN, 2012); (OLLIER-MALATERRE & FOUCREAULT, 2018) and (HOUSE, DORFMAN, JAVIDAN, HANGES, & LUQUE, 2013).

FIGURE 3 – Modified GLOBE Theoretical Model 2013

Source: (HOUSE, DORFMAN, JAVIDAN, HANGES, & LUQUE, 2013)

Theoretical model based their approach in the cultural dimensions that are conveyed on the regulatory framework which forges the people interaction way of life. These cultural

dimensions presented in the FIGURE 02 have coincides and non-coincides that are discussed and addressed as following.

Power distance addresses the extent to which the less powerful members of a country's institutions and organizations expect and accept that power is distributed unequally which brings to light the workings of dependency relationships. In cultures where there is a high rate of power distancing, it is noticed the favorability to inequality between people, so that it is well evidenced that those who have less power must depend on those who have more power. In this sense, there is a tendency to centralize, and employees expect the manager to tell them exactly what to do, a fact that denotes little desire for autonomy. The dimension measures the degree to which members of a collective expect (and should expect) power to be distributed equally, considering that there are opposite forces that push the equilibrium back frequently. On the other hand, in societies with a small hierarchical distance, the inequalities between people are mitigated, which favors the interdependence between those who have more power and those who have less. In this case, in relation to organizations, employees like to be consulted about the decisions that will be made, which generates a more decentralized structure, with low dependence of employees on leadership (HOFSTEDE G. , 2003) and (DORFMAN, JAVIDAN, HANGES, & DASMALCHIAN, 2012).

Individualism, on the other hand, is directly related to social preferences and lifestyle versus collectivism, which will favor group interests. This dimension considers the people integration level into groups in a society. In cultures where individualism prevails, the bonds between individuals are not strengthened. In cultures where individualism prevails, the bonds between

individuals are not strengthened. On the contrary, in cultures with collectivist emphasis, people, from birth, are strongly integrated, cohesive, and families continue to protect each other in exchange for unquestionable loyalty (CASAGRANDE & MACHADO, 2016) . Under the same criteria the **Institutional Collectivism** and **In-Group Collectivism** measures the enough effort which encourages individuals express their feelings in a such case of the group that they belong with (pride, loyalty, etc) aligned with the organizational and societal institutional practices put in place to recognize and reward the individuals and their groups (ALAS & TUULIK, 2007).

Masculinity versus Femininity dimension brings a meaning related to the masculine and feminine adjectives. In this index composition, it is admitted that a man can behave in a feminine way and a woman, in a masculine way. This question is approached from the behavioral aspect, and masculine and feminine behaviors are different in both traditional and modern societies. Regardless of the type of society, there is a marked convergence within that is expected as masculine behavior, linked to firmness, competition and rigor, in contrast to what is expected as feminine behavior, characterized by delicacy, tenderness and generosity (CHANG, 2003). **Gender Egalitarianism** under the GLOBE Project is looking for understanding not about the behavioral aspect in terms of the societal practices, but it measures the practices or the taken for granted that minimize or maximize the gender inequality. How much that environmental promotes action in the gender equality direction in all the areas and pillar of the society (DORFMAN, JAVIDAN, HANGES, & DASMALCHIAN, 2012)

The **Uncertainly Avoidance** dimension expresses the degree to which members of society are uncomfortable with uncertainly and ambiguity. The fundamental question here is how a society

deals with the fact that the future can never been known and what are the abilities to control the future or to adopt a passive behavior to what is to come (HOFESTEDE, 1993). Aligned with the Hofstede´s dimension, GLOBE projects the uncertainty avoidance on mapping the society, organizations and groups patterns in terms of relying on social norms, rules and procedures to mitigate unpredictable events that come from the volatile future (JAVIDAN & DASTMALCHIAN, Managerial Implications of the GLOBE Project: A study of 62 societies, 2009). Cultures that avoid uncertainly try to minimize the possibility of such situations through strict codes of behavior, laws, rules, and disapproval of divergent opinions. The opposite type, in other words., cultures with low uncertainly aversion, are more tolerant of divergent opinions, try to have fewer rules, and, in the philosophical and religious aspect, are empiricists, relativists, and allow different currents to flow side by side. People belonging to these cultures are more phlegmatic and contemplative (CASAGRANDE & MACHADO, 2016). The willingness is about the people desire to seek orderliness, consistency, structure, formal procedures and laws to control and define the routines and their daily lives (KOOPMAN, DEN HARTOG, & KONRAD, 1999).

The fifth dimension called **Long-term Orientation** assesses how societies preserve ties to their own past while dealing with the challenges of the present and the future. Societies prioritize these two existential goals differentially. Those with a low score on this dimension, for example, prefer to maintain time honored traditions and norms while viewing social change with suspicion. This dimension is represented by the **Future Orientation** in the GLOBE Project which more focus on the individual approach abilities than society which they belong with. It measures the individual engagement about his/her future-oriented behaviors such as planning, career path, lifestyles on 80s (OLLIER-MALATERRE & FOUCREAULT, 2018). Those with

a high scoring culture, on the other hand, take a more pragmatic approach: they encourage the economy and efforts in modern education as a way to prepare for the future (HOFSTEDE G. H., 2020).

Finally, the last dimension called **Indulgence** represents a society that allows relatively free gratification of basic, natural human impulses related to enjoying life and having fun. Restraint represents a society that suppresses the satisfaction of needs and regulates it through strict social norms (CHANG, 2003). Referring indulgence under an adapted perspective, the GLOBE Project announced the **Humane Orientation** dimension which in a such way, promote and encourage the collectivism and individual rewards for being fair, altruistic, generous, caring and kind to others. Both dimensions under their specific methodology are willing to identify an enjoyable and feasible life which connects and lands off the individuals to their group across their entire life (HOUSE, DORFMAN, JAVIDAN, HANGES, & LUQUE, 2013).

On top of describing the 6 Hofstede's dimensions and their similar pillars that come from the GLOBE Project, two additional dimensions are identified that there is no representative aspect under the Hofstede approach. **Performance Orientation** and **Assertiveness** complete the GLOBE Project dimension with a such level of correlation even though they are measured in separate. While the Performance Orientation searches the level of moving individuals forward in the performance improvement and excellence; Assertiveness measures how aggressive individual are in their relationships with others.

Although there is independence of the dimensions in their bipolarities, it is possible to identify standards of comparisons (CHANG, 2003) . Table 2 seeks to characterize the differences between the 4 (four) main cultural dimensions of Hofstede.

TABLE 2 - Measurement and the Hofstede Scale - Bipolarities

Scale \ Dimensions	Power Distance	Uncertainly Avoidance	Individualism & Collectivism	Masculinity & Feminility
High	Social differential (status hierarchy)	Formal relationships (structure, rituals)	Self-determination (personal growth)	Controlling relationships (competitive behavior)
Low	Social Integration Equal status	Informal relationships (less control)	Collectivity (group harmony)	Relationships creation (less competitive)

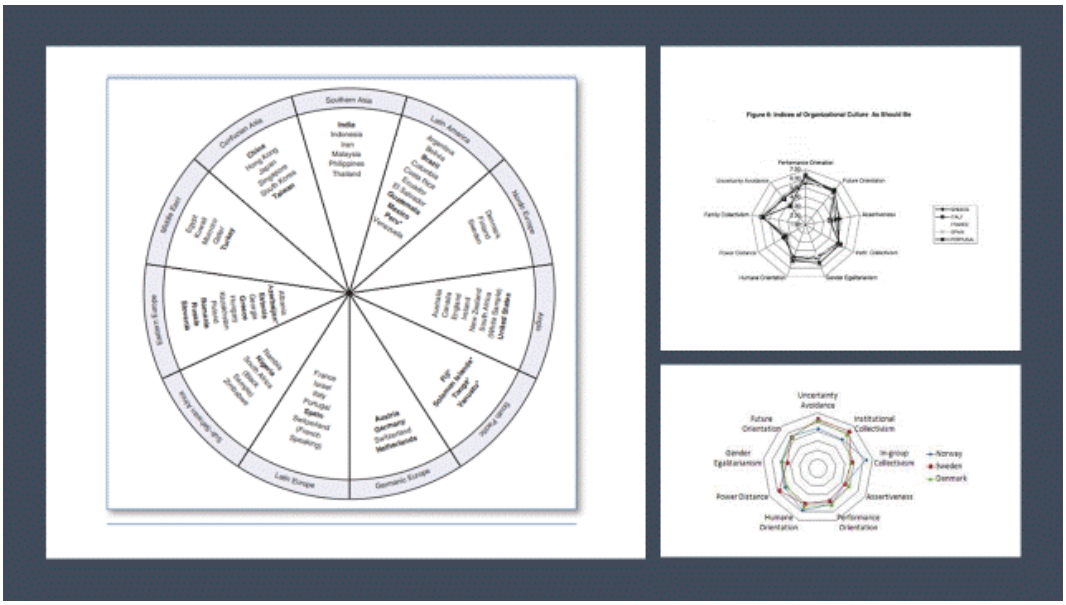

Source: (CHANG, 2003)

Although all of Hofstede's work has suffered harsh criticism throughout its adaption and post-publication process, he was not shaken at all. Hofstede himself listed five of the main criticisms of his approach. The first criticism points out that only the application of a single questionnaire cannot be satisfactory for measuring cultural differences. The second is that nations are not the best units to study cultures. The third and fourth place their spotlight on the sample used, i.e., the subsidiaries of a single company cannot provide the information of the respective national cultures and such company (IBM) has outdated market data. Finally, the last criticism points

out that only 4 to 5 dimensions would not be enough to support a proposition and comparison between national cultures (HOFSTEDE G. , 2003),

Building on the bipolarities, the GLOBE Project realized that opposite side may be addressed by the cultural country dimension in a such way that patterns, norms and procedures have been forging the country´s society for long years, drawing a common framework to reduce the uncertainty and conform the life pace. The cultural dimension construct debate remains while Hofstede and the GLOBE Project have been used in international academic and business research. As much as the GLOBE Project updates its research year over year, the model suffered adjustment, clustering the dimensions in group of countries as presented by the FIGURE 04

FIGURE 4 – All Countries in GLOBE 2004 and Current GLOBE CEO Study

Source: (HOUSE, DORFMAN, JAVIDAN, HANGES, & LUQUE, 2013); (NIKANDROU, APOSPORI, & PAPALEXANDRIS, 2003) and (WARNER-SODERHOLM, 2012)

The Globe (Global Leadership and Organizational Behavior Effectiveness) research program was designed to measure country cultures under two main pillars: societal practices and value practices. While the societal practices typically refer to a set of parameters of collectives that differentiate each collective in a meaningful way (MASELAND & VAN HOORN, 2009); value practices measure desired states rather than desired changed, reflecting on broad tendencies than an individual perspective (BREWER & VENAIK, 2010).

The GLOBE research has been running under nine dimensions, having its data collection consolidated for both societal practices ("as is") and values ("should be") measured for each dimension. The outputs and their further analysis usually provide the real spread between practices and values. As much as the spread higher, the country is faced on a complex scenario in terms of managing the divergencies across the society (BREWER & VENAIK, 2010).

On top of analyzing the country per se, other comparison evaluation may be conducted between countries as present in the Figure 04. The internationalization process, accelerate the go global to market which impacts significantly the societal and value practices. Operating across international boundaries, people are moving across the global more often than in the recently years. Therefore, questions related to cultural influences has been raising on the top of government and companies agenda priorities (BREWER & VENAIK, 2010); (NIKANDROU, APOSPORI, & PAPALEXANDRIS, 2003) and (WARNER-SODERHOLM, 2012).

Digging on the country cluster analysis, the evidence produced by the GLOBE Project results reinforces the first two hypothesis discussed in the thesis as following

H1: There are significant group differences, for informality rules in the organizational engagement process, in the global (cross-country) glass packaging company, when grouping by countries.

H2: (on practices) There are correlations between societal practices and the organizational engagement process.

H2: (on values) There are correlations between societal values and the organizational engagement process.

2.2.4. ASSERTIVENESS AND INDIVIDUALISM – COLLECTIVISM

Individualism – Collectivism and Assertiveness are cultural dimensions that affect directly psychological processes such as Assertiveness cultures tend to be less collective, on the other hands small Assertiveness Cultures tend to be more individualistic (FISKE, MARKUS, KITAYAMA, & & NISBETT, 1998).

There is a large set of research that explains the impact from Assertiveness and Individualism – Collectivism to the companies and employee's connection. Both influences directly the employee´s behaviors at the workplace that are manifested in their sense of belonging, one of the main elements which tie and connect employees to their companies. (COCROFT & TING-TOOMEY, 1994); (GUDYKUNST, et al., 1996); (IMAHORI, 1994); (MERKIN, 2004); (OETZEL & TING-TOOMEY, 2004) and (SINGELIS & BROWN, 1995) .

Assertiveness is the concept of how organizations distribute it in an unequal way excepted and accepted by the less powerful individuals at the companies' levels. Employees in large

Assertiveness companies understand that power/dominant must be distributed unequally way while employees in small Assertiveness cultures require that aggressiveness must be distributed slight equally. These characteristics affect directly the sense of employee´s belonging, emerging behaviors presented at the shop floor to the top floor such as sense of obedience, verbal expression and injustice (OETZEL & TING-TOOMEY, 2004) , (SINGELIS & BROWN, 1995) and (CALZA, ALIANE, & CANNAVALEC, 2009)

Deeping dive on the Assertiveness concept and its cultural aspect, research point out that obedience is not a characteristic usually found on small assertiveness cultures in a way that these companies usually incentive the value participation in decision making, challenging the authority bias and challenging the current status quo. On the other hand, in small Assertiveness cultures, employees avoid conflicts and face-to-face tough and hard conversations where such kind of attitudes can be faced as threatening despite of any opportunity to raise bar in the company's performance (COCROFT & TING-TOOMEY, 1994).

Employees belonging to small Assertiveness cultures believe power must be legitimated before using or pushing employees back. Therefore, employees' members possessing large Assertiveness authority and social inequality, explains Hofstede (1993) and House (2013). As a basic societal fact, employees from large Assertiveness culture stress coercive or referent aggressive. So, large Assertiveness cultures easily do not accept coercive autocratic power, obediently following orders more than individuals from small Assertiveness Cultures. Indeed, assertiveness is considered as a basic fact of society which legitimates the sense of belonging in the small Assertiveness cultures. Consequently, in large-Assertiveness cultures, defiance of

autocratic power is facing threatening (HOFSTEDE G. , 2003). In these company´s cultures, employees are not afraid of deviate from what is expected which is more impacted when the engagement levels are usually quite higher due to there are no alternatives available at the market. Moreover, individuals from large Assertiveness cultures are reluctant to trust each other which impacts engagement level directly into the teamwork and growth perspectives (GUDYKUNST, et al., 1996).

Subservience and conformity are the main elements presented in the cultures with low level of Assertiveness. Therefore, when it is necessary for people from large Assertiveness cultures to interact with others, they engage in obedient, peaceful, cooperative communication strategies that compromise or collaborate with others (COCROFT & TING-TOOMEY, 1994). Strategies of cooperation and teamwork emerge to demonstrate deference, reverence and respect in an effort to smooth over potentially face-threatening events. At an organizational standpoint, more assertive organizations tend to impose their decisions on their employees, assuming the control of their expected behaviors. Individuals from large Assertiveness organizations usually believe that others are opportunists, generating noises internally and externally (CALZA, ALIANE, & CANNAVALEC, 2009).

Hofstede (2003) and House (2013) reinforces small Assertiveness Cultures prefer collectivism instead of individualism where obedience, conformity and non-cooperativity are also avoided. Hofstede and the GLOBE Project score for collectivism and Assertiveness have predictive validity on relation to social behaviors and their sense of belonging. Indeed, cooperative interactions and large Assertiveness cultures have positive correlation with collectivism. Thus, it is reasonable that employees from large Assertiveness company´s culture would also rather

using cooperative relationship, increasing their sense of belonging which impacts significantly positive the people engagement.

As part of the binomial approach Assertiveness and Individualism, Hofstede (2003) and House (2013) identified a strong correlation which impacts the employee´s behavior at the workplace. A large set of research have been showing that collectivism and individualism variables are presented across the company´s cultures and employee's behaviors. Both are associated to a syndrome of feeling connected to their groups and companies to make what matters to increase the sense of belonging and how one side puts itself in other shoes. Key elements captured from the engagement concept are borrowed in a way of increasing the job satisfaction (WHELLER, REYS, & BOND, 1989) and (JAVIDAN & HOUSE, 2001)

Hofstede (1989) presents harmonious relations as part of the key element which connects the dots between large collectivism and small individualism cultures. Indeed, collectivism impacts job satisfaction in a way of preserving interpersonal harmony and its sense of belonging. A large individualist company´s cultures expect that employees take care of only themselves, focusing on their goals and career steps. In an opposite way, large collectivist company´s cultures presume that goals and growths are completely tied to the group and social wellbeing. In that case, the employees usually move ahead into the companies when their groups grow up as well (REALO, ALLIK, & GREENFIELD, 2008).

The sense of belonging is a factor which boosts the employee´s engagement at the organizational levels. It is this factor that affects the employee´s capability where they will find their personal meaning on executing their jobs. Employees feel connected to their organizations

when the sense of belonging is activated. These relationships have been stablished beyond to the employee´s routines. It connects throughout employee´s emotionally engagement which represents better organizational results (BELLE, BURLEY, & LONG, 2014). The workplace belongings are presented inside the company completely aligned in the decision-making process where they are being accepted and respected into those process.

Sense of belonging is tied connected to the sense of collectivism. Feeling part of the companies, employees made immeasurable efforts to do more in order to achieve better results. They usually are sure that count on others to overcome what is expected on a regular basis. On the other hands, large individualist company´s cultures stress on own results despite of pressuring or impacting others. It is a workplace where do not matter others feelings, speeding up anxiety, fear, isolation and most of the case depression and mental diseases (SINGELIS & BROWN, 1995).

Recently this binominal dimension has also become one of the main elements to understand much better the cross-cultural business. The individuals versus communities has been identified as the key of balancing the neutral and affective emotions that connect employees to their organizations (SMITH, DUGAN, & TROMPENAARS, 1996). The relevance of this particular dimension of culture to the management literature lies in the fact that Anglo countries are at the extreme individualist end of the scale, and so business partners from almost any country they try to do business with are bound to have more collectivist culture. This hypothesis was supported by Inglehart (2000) who analyzed the individuals and societies 'priorities that depend on the socioeconomic aspects. Scarcity countries are usually focusing on the value of survival. On the other hand socialization takes place where the relationship between the socioeconomic

environment, planning, and value priorities are not of immediate adjustment; a substantial sub-range of time is involved for one's basic values to reflect that prevailed during pre-adult years (CALZA, ALIANE, & CANNAVALEC, 2009).

Variation along the dimension of collectivism versus individualism also affects value systems and the functioning of institutions aside from the employees, such as engagement, commitment and companies – employee´s results. Hofstede (2003) incorporates a host of other studies that confirm the occurrence of the dimension and its relevance to many societal phenomena. These include the kind of processes that occur in employee-companies' relations: whether to show their feelings and beliefs, whether to confront the other party or not, how to distribute favors, and the like. Table 3 shows typical distinctions relevant for trade.

TABLE 3 - Collectivism and Individualism distinctions

Collectivism	**Individualism**
Harmony Maintenance – Conflict Avoidance	Your mind speak up
Communication Implicitly	Communication explicit
Overall Wellbeing ("We")	Own Wellbeing ("I")
Show favor to in-group customers	Treat all customers equally
Business under the people relationship	Task oriented than people interaction
Relations are given	Build and maintain relations active
Group interests	Personal Interests

Source: (HOFSTEDE G. , 2003)

The main distinction between collectivism and individualist practices resides in a way of creating inter and intra collectivism mindset where employee´s relations are more relevant than business results. Businesses tend to be done among high level of engagement in contexts that individualistic mindsets do not seem fit for business. In and individualistic company´s culture tend to be a strict separation between a large set of life, e.g., professional, and personal, businesses and families. Otherwise, in a collectivist company´s cultures, one tends to do all of these things with the same extended group of employees (SMITH, DUGAN, &

TROMPENAARS, 1996). The term “in-group” is often used to denote this kind of self-evident unit of company´s activities at large as it exists in collectivist societies. Building strong relationships and establishing a working relationship with them is usually easy in these societies. The usual way is to use existing business and employees’ relationships to achieve results. The high level of belongingness is identified where the engagement are boosted at the same time employees are no longer felt tied to the organizations (TRIANDIS, 1995).

2.3. ENGAGEMENT AND ORGANIZATIONAL COMMITMENT

2.3.1. CONCEPTUALIZING AND DEFINING

Engagement and organizational commitment are concepts that have never been so theatrical and practical relevance at the academic and business agendas. Even thought, it has been studying for so several years, there is not a standard definition about them due to cultural differences and country values (BASTOS, 2014). However, as much as the organizations and universities have been identifying these constructs as part of getting better business results, the conceptual expressions were expanded with a set of divergences presented by organizational actors for the same phenomenon (REICHERS, 1985). Adding to this research´s approach, the organizational context, countries aspects and company types are the key elements that impact substantially the commitment and engagement at the organizational levels (SCHEIBLE A. F., 2013). As much as the studies move forward, there was a researcher´s wave ho proposed, at the time, new dimensions and new scales for commitment (MEYER & ALLEN, 1991); (MOWDAY, R.T. et al, 1982); (MAGALHÃES, 2008).

Commitment is also includes the power of belongs demanded by each member´s needs. Before reframing it from this perspective, conceptual commitment considered the main idea of permanence's needs aligned with such as employee-organization inter-relationship. Commitment and engagement are concepts that move hand in hand completely linked to the sense of belonging that motivates researchers to investigate the reasons why workers remain or leave the companies (ALLEN, 2016). Motivations have been changing for several years due to two main aspects: the first one is aligned with the rules and criteria that establish the labor relations from command and control to an inspiration and purpose role modeling; the second is

about the evolution of the academic research that are getting better results and deep diving on their analysis. this is no longer the main concern of organizations and workers, since active contributions are increasingly expected instead of passive continuity (RODRIGUES & BASTOS, 2010). The perfect symbioses between commitment and engagement that usually calls sense of belongness happens where workers perceive their active contributions that have been increasing significantly instead of their passive contributions (WASTI, 2016).

News trends and perspectives were figured out when all workers expectations were included and considered as part of the phenomena, changing the conceptual framework. Researchers started seeing the different types and nature of connect points between companies and workers. Beyond to only one dimension, Klein (2012) and Bastos et al (2014) add to the multidimensional structure analysis that forces the idea about this a journey in course instead of a construct well-known at academic and business agendas. Klein (2013) clarifies why defining commitment at work is not a simple task. . Klein (2013) and Rodrigues and Bastos (2010) used content analysis on the definitions of commitment in literature and reached the same conclusion: redundancy and imprecision of the approaches.

Indeed, after Klein (2014) new one - dimensional scales were proposed for more precise definition and operationalization of commitment which emphasizes the same essence of the affective basis and on the volitional character of the bond. This analysis eliminates the workers' needs where their presence is important which characterizes the continuance basis instead of the obligation by the normative rules. It represents that historical institutionalism no longer forge so much the behaviors and workers attitudes at the workplace in one way. It means that

there are more than the agency´s perspective to stablish a healthy labor relationship (SCHEIBLE A. e., 2013). These basis are derivate from the antecedents that push back to equally diverse effects on the both sides (workers and employer organization) in order to reorganize the equilibrium (ETZIONI, 1974).

2.3.2. ENGAGEMENT AND COMMITMENT MEASURING PROCEDURES

The long-term presence at the workplace related directly to the high rates of commitment includes the idea of needs. Thus, permanence had remained for several years as the major concerns around the research's focus that motivates authors investigating the link between workers that remain or leave the companies (ALLEN, 2016).

Carson (1995) argues that there is a unique broad framework where the sense of belonging which boosts the continuance basis represents a set of behaviors. These sets of behaviors are not completely related to the attitudinal aspects whose object is the organization and companies.

Measuring procedures have investigated the relationships between the continuance basis and desired variables is attributed to this difference, since this dimension measures the advantage in remaining, or the nonutility of leaving the organization, due to the costs associated with leaving. Despite of that culture aspects at the country, company and group level are not considered in most of the studies analysis in this thesis, impacting directly the analysis. Thus, the authors consider it understandable that no significant relationships are found between desirable behaviors, such as organizational citizenship, and the usefulness assessed by the

individual in remaining in the organization (continuance commitment) (HOFSTEDE G. H., 2020); (BOURNE & JENKIS, 2013); (CARSON & BEDEIAN, 1994).

Additionally, there is a gap identified on the scales used year by year, comparing how the engagement and commitment increase or decrease inside the companies. Possible cultural factors are pointed out by recent authors that may affect substantially the scales used when applied in other countries. The trends observed as the outcomes present a large list of variables that are not considering on measuring the continuance basis (RODRIGUES & BASTOS, 2011)

Those commitments aspects are compounded by two main dimensions that include the workers perspectives: high personal sacrifice and few perceived alternatives. The second one are defined by the worker´s previous experience which calls antecedents and in fact, it is not a sense of belonging component. Indeed, the personal sacrifice represents the better theoretical basis of continuance commitment (CARSON & CARSON, 2002); (CARSON K. e., 1995).

Latest researches results reinforce that that the continuance basis presents a pattern of relationships opposite to that observed for the affective and normative basis. Organizational support, job satisfaction, work- relationship, trust and fairness impacted positively to the continuance commitment and the organization´s performance . On the other hand, there are variables such as conflict, negligence, and absenteeism, present positive relationships with the continuance basis and, conversely, negative relationships with the other bases (BUCHANAN, 1974); (BASTOS, 2014); (MEYER & ALLEN, 1991); (SCHEIBLE A. F., 2013). In fact, theses analysis provoke the sense of aligning the continuance basis and commitment at the same time

that those concept must not be dealt under just one dimension regarding to high correlations factors found between the normative and affective basis. In parallel, the evolution is conveyed under the Institutionalism where different agencies (state, employers, workers, groups) are debating to re-stablish the better results for the group (HALL & TAYLOR, 2003); (MEYER & ALLEN, 1991); (MEYER & ROWAN, 1977).

2.3.3 SENSE OF BELONGINGNESS AND EMPLOYEE´S ENGAGEMENT

Prior discussing about engagement into the organizations and their employee´s relationships, literatures have been identifying the key elements that support the sense of belongingness. This sense is a factor which boosts the employee´s engagement at the organizational levels. It is this factor that affects the employee´s capability where they will find their personal meaning on executing their jobs. Employees feel connected to their organizations when the senses of belonging is activated. These relationships have been stablished beyond to the employee´s routines. It connects throughout employee´s emotionally engagement which represents better organizational results (BELLE, BURLEY, & LONG, 2014). The workplace belongingness are presented inside the company completely aligned in the decision-making process where they are being accepted, respected into those process.

Cooperation and support are behaviors and attitudes often presented in the workplace when high rates of belongingness are identified from coworkers and management. Otherwise, isolation and unhappiness are identified when there is a lack of belonging´s sense. Thus researchers started keeping focus on the depressive symptoms (COCKSHAW & SHOCHET, he link between belongingness and depressive symptoms: An exploration in the workplace

interpersonal context, 2010). As part of their research in Australian, both indicated the importance of having a sense of belongingness in the workplace directly affects the profitability of the organization and employee engagement. Cochshaw and Shochet (2014) figured out that the sense of belongingness is directly related to acceptance, teamwork, support and respect. The importance of belonging is a strong affirmation that it is perhaps one of the most important aspects of human engagement. Both further have argued that individuals who were found to have a strong desire to belong were more cognizant of procedures than those with a weak desire to belong. It was found that organizations should encourage employees' sense of belongingness to enable employees to be more engaged.

Employee´s engagement is an organizational challenge which matters to both the organizations and the employees as well that impact the global economy where the business taking places. An organization is an agency regulated by rules and regulations from a broadly stakeholders perspectives where employee´s contracts are defined in order to achieve the organizational goals and objectives. Management's capability to leverage employee engagement strategies is essential in an organization (MC CUISTON & DELUCENAY, 2010), (MARCH & SIMON, 1993) and (NELSON & WINTER, 1982).

Most of the researchers that have been conducted for several years were looking for establishing a high level of expectations and frequent performance reviews can increase employee participation and cooperation while the resource´s over demand and non-availability has been pushing back the organizations move the layoffs and effectiveness forward (AHMETOGLU, HARDING, AKHTAR, & CHAMORRO-PREMUZIC, 2015). In parallel,

attraction and retention processes have been improved to get high level of engagements which has been reduction the process´s variations, impacting on cost savings and business performance (EMROUZNEJAD, ANOUZE, & THANASSOULIS, 2010).

As one of the most emerging challenges in the business and academic´s agendas today, employee´s engagement is an area of concerns, stretching organizations on developing new guidelines across the entire Strategic People Agenda. This aspect challenges management since engagement is a critical element in maintaining the organization's vitality, survival, and profitability (CARTER & GREER, 2013). Further researches on evaluating the impact of employee´s engagement in the business performance, indicated that high levels of engagement were coincidently presented at company with the high levels of results mentioned by Gallup Consulting and Society of Human Resource Management (SHRM) reports (MANN & DARBY, 2021). The organizations that were impacted, experienced increased customer satisfaction, profits, employee productivity, and earnings per share with publicly traded organizations (VANDENABEELE, 2014).

Indeed, the leadership are directly contribute to raise the employee´s engagement results. Balancing moral perspectives with interpersonal relationships can create a healthy leadership-employee relationship. Employee engagement that is improved is a by-product of leadership that has a direct relationship with employees (LOWE, 2012). Leaders play a role inspiring their employees and giving them opportunities to grow that represent one of the most critical engagement´s element. Providing vision and direction, leadership connect employees to the

company´s purpose throughout the communication skills as part of the engagement´s basis (BELLE, BURLEY, & LONG, 2014).

Other relevant topic considered of employee´s engagement focus is the organizational and individual's purpose alignment where employee´s expectations convey to the organizational goals and targets (CARSON & CARSON, 2002). There are two critical parameters that reflected the engagement at the organizational level. The first one is the willingness to contribute to organizational success and the second one is a positive and energized employee who is at a motivational moody (COOPER-HAKIM & VISWESVARAN, 2005).

Bansal (2015), Carson et.al (1995) and Lowe (2012) converge defining the engagement as the extent in which employees are willing to commit both emotionally and rationally within their organization, how long they are willing to stay as a result of that commitment, and how dedicated they are to their work. Employee engagement is related to the psychological experiences of people who shape their work process and behavior.

Curiously, as the employee engagement is considered a multidimensional perspective, there is no evidence that culture aspects are so relevant to the point of modifying their results 'analysis or adapting the surveys that they usually apply into the companies as a standard. As previous mentioned, leadership and culture influence directly to the employee engagement and on how employees define their company´s perspective regarding to their opportunities to grow, challenges and career path. These elements connect employees to the company emotionally, physically, and cognitively in their daily work (ELDOR & HARPAZ, 2015). On the same flow,

Shuck and Wollard (2010) add the cognitive, emotional and behavioral aspects under the employee engagement definition aligned with the concepts of behaviors and belief prior discussed at the academic perspectives (ROKEACH, 1973). Thus, organizations are responsible for providing guidance and trainings in order to build the meaningful of the workplace´s atmosphere. Most of the organizations understand the engagement pillar relevance for sure (ALLEN, 2016). However, the current economic and political challenges have impacted company's decisions to execute their strategies top down and bottom up that increase significantly employee engagement rates. These challenges are also impacted by cultural aspects and the leadership skills on how deploying them inside all organizational layers (COCKSHAW & SHOCHET, 2014)

The communication process blooms up the key for promoting the high levels of engagement, establishing two-ways processes from leaders to employees and from employees to leaders, reducing steps and amplifying the daily warm contacts. As much as the communication process are handled by the two-ways, the opportunities grow, proving employees proper resources for being successful (TAYLOR & KENT, 2014). These opportunities involve problem strategic solutions process, feedback, respectful conversations and ideation processes.

On the other hands, as much as the companies increase their engagement rates, they forges the employee´s behaviors, satisfying their needs that has been discussed across the thesis background from to basic needs to the emotional aspects. Companies, playing their roles as a institutions, keep focus on modeling the right behaviors and attitudes at the organizational levels, providing a psychologically safe workplace to improve employee engagement

(AHMETOGLU, HARDING, AKHTAR, & CHAMORRO-PREMUZIC, 2015). On Latin Country Cultures, the psychological ownership set the safe workplace awareness that make employee feels satisfied and enthusiastic in work-related activities. This element reinforce once more the emotional aspect regarding to engagement concept (BANSAL, 2003). As mentioned by Mann and Darby (2014), Gallup Consulting has been conducting a large research of engagement aspects and its organizational impacts for several year throughout running surveys across the companies around the world. The results indicate that better engagement levels bring organizational earnings per share increasing which becomes relevant not only for the academic perspective that is willingness for solving societal problem but it becomes relevant to the business strategic agenda.

The Gallup´s Employee Engagement Q12 survey also indicates that 30% of the population analyzed are extremely engaged at work and others 20% of the research´s sampling are completely disengaged. In parallel, a high number of employees fail in contributing at work shown the research after 12 years of surveying worldwide (SHUCK & WOLLARD, 89-110). The organizational performance was also evaluated, measuring the engagement of more than 27.000K employees, finding the large variance between group despite of segment , size or location (SORENSON & ROYAL, 2020).

There are other aspects positively impacted by the high engagement rates such as low levels of absenteeism and turn over, high level of organizational loyalties, productivity improvements indicators, overall satisfaction where the emotional and intellectual commitment boots the organizational tangible and intangible results (BELLE, BURLEY, & LONG, 2014). Employee

engagement is also defined as attention and absorption that consider the amount of time spends thinking organizational roles (attention) and the how employees are intensively active playing their roles (absorption) (SAKS & GRUMAN, 2014).

Employee engagement research could be broken down in two waves of studying at the academic levels. The first wave correspondents in 80´where companies usually analyzed employee´s needs to improve the workplace. The next wave took place in 90, moving the direction from needs to employee´s satisfaction. After 90´, researchers had studied the contributions related to high level of employee engagement, looking for reducing cost while the productivity has been increased (AHMETOGLU, HARDING, AKHTAR, & CHAMORRO-PREMUZIC, 2015). At this time, organizations were also motivated by their board of directors to implement motivation strategies inside the companies and across the all layers. However, as much as the companies have been spending time on these strategies, the results have been conveying directly to be stable in terms of company's results and works. Here, leadership identifies steps to create psychologically safe workplace which created a culture of psychological ownership and engagement (BELLE, BURLEY, & LONG, 2014).

Satisfaction and enthusiasm are elements observed at organizational levels in workplaces where the employee engagement rates increased across the years. Low levels of satisfaction impact directly to the productivity rates and customer services skills as well. Indeed, workplace must be where can be confident with building trust and communication without thought of being fired (FARNDALE & MURRER, 2015).

In general, employee engagement management process drives results. Business outcomes are positively impacted by high levels of engagement. Moving throughout the organizational layers, statures, activities and routines, the employee engagement management processes have been dealing with emotional characteristics that are not usual to be administrated under the same business agenda. That´s the reason that old fashion process based on repetitions are now replacing by intellectual contributions at the workplace. Management must identify skills that can enhance employee engagement and performance, giving employees more exposure to be in contact with all value chains which means increasing a sense of belonging. Thus, employees who demonstrate improved engagement are those that proactively personalize their daily job demands (COCKSHAW & SHOCHET, 2010).

Finally, most of the research related to employee engagement provides guidelines and principles to run the business promoting self-stem and satisfaction at the workplace. Tools, surveys and devices have been created and designed in order to improve communication, teamwork, and ownership. However, the engagement is also impacted by culture´s trends in a way that most of the engagement pillars are based on employee´s behaviors and beliefs. New researches should be conducted to fit the employee engagement results with the local culture and its beliefs (ALLEN, 2016); (BUCHANAN, 1974); (BOURNE & JENKIS, 2013); (CARSON & CARSON, 2002); (COOPER-THOMAS, PATERSON, STADLER, & SAKS, 2014) and (MC CUISTON & DELUCENAY, 2010).

Finally, as the employee´s engagement is based on emotional and rational perspective, considering the advantage of remaining versus nonutility of leaving, these costs are associated

how employees are feeling tied to the organizations in a way of raising their satisfaction up aligned with their purposes (ALLEN, 2016); (BANSAL, 2003); (BELLE, BURLEY, & LONG, 2014); (CARVALHO, 2011); (COCKSHAW & SHOCHET, 2014); (FARNDALE & MURRER, 2015) and (KANTER, 1968).

2.3.4. ORGANIZATIONAL COMMITMENT

In general, most organizations have been looking for new ways to develop workplace where employee fell committed to the organizational propose and make all the efforts in order to salve the daily and strategic main problems. Therefore, organizations have been led to a review of their practices of management, behavior and relations with its employees, seeking to get to know them and understand them, in order to obtain greater commitment and better effectiveness in their process (ROWE & BASTOS, 2007).

Organizational commitment, employee engagement and sense of belongingness are constructs that have been researched for several year as a relevant topics helping organizations achieve their goals. Educations Institutions are also being successful in their endeavors when they have people willing to make additional efforts to obtain better performance as finding at the organizations as well (FARNDALE & MURRER, 2015).

Organizational commitment is defined as the best fit identification between workers and the company (mission, vision, objectives) reinforcing the employee wishes of remaining. High levels of commitment contributes to companies achieving their organizational goals and having better performances (ROBBINS, 2005).

Despite of the commitment relevance as same as happens with engagement has been facing on framing the theoretical boundaries relating organizational successful and individual satisfactions. There are different approaches under the same meaning which impacts directly in a way of measuring at the workplace (OSIGWEH, 1989). Thus, the commitment definition is also under defining as its measuring procedures have problems with reliability and validity (RODRIGUES A. C., 2009).

Researchers are still looking for findings that support them in order to separate the principal concepts and constructs such as commitment and engagement and entrenchment. Organizational entrenchment, as proposed in the research conducted by Rodrigues (2009), is defined by a need to stay in the organization, because of the belief that leaving would entail emotional or financial costs, and because of a perception of limited alternatives in other organizations. These researches assume that there are workers who stay in the organization by desire, seen as committed, and there are also those who stay in an organization by necessity, seen as entrenched (RODRIGUES A. C., 2009).

The organizational commitment and organizational engagement literature reviews by Bastos (2010); Carvalho (2011); Pinto, Bastos and Rowe (2010); and Eldor and Harpaz (2015) identified the existence of a significant positive relationship between commitment and entrenchment, as predicted in the theoretical model of entrenchment. Therefore, employee engagement research followed the broad trend based on the organizational behaviors (SCHAUFELI & BAKKER, 2004). There are at least four reasons why engaged employees perform better than non-engaged employees engaged employees: engaged employees exhibit

positive emotions more frequently, such as happiness, joy, and enthusiasm, experience higher levels of health are able to create their own personal resources and transfer engagement to others (BAKKER & DEMEROUTI, 2009).

Organizational commitment has been becoming relevant in the academic, scientific, and business agenda under the organizational behaviors field. After 70´, the number of research and their publications on the work engagement side have been increasing tremendously. This research have been focusing on what links individuals to their work environment and what are the implications of such bond to this individual, to the work, and to the work and the organizations (BASTOS, 2014). Organizational commitment research started to deep understand the meaning of the construct. However, there are several concepts of commitment published across the globe in different languages and cultures. It evidences how relevant is the culture analysis when an engagement and commitment process are being conducted inside the companies. Most of these concepts have identified meanings related to behaviors and the relationship between workers and their companies such as: trust, sense of belonging, self-stem, interdependencies, purpose and honesty (BELLE, BURLEY, & LONG, 2014).

At the academic level, commitment means inclusion: an internal personal force which links definitely workers within various aspects of the work environment, promoting a strong unity between all of them and stablishing the behaviors acceptable in these relationships. This set of behaviors are forged primarily by the organizations as described by Hall and Taylor (2013) when defining the sociological institutions. Indeed, commitment is described as a tendency of the individual to engage in "consistent lines of activity" (PINHO, BASTOS, & ROWE, 2010).

Nevertheless, there are emotional components that cross the analysis related to engagement, commitment and belonginess . Fondness and other affective approach determine the long-term relationship between workers and their companies (MOWDAY, STEERS, & PORTER, 1979). For the authors, commitment goes far beyond an attitude of passive loyalty to the organization; it also involves an active relationship that seeks the organization's well-being. Organizational commitment can be characterized by at least three factors: (a) a strong belief in and acceptance of the organization's goals and values; (b) being willing to exert considerable effort for the benefit of the organization; and (c) a strong desire to remain a member of the organization. (BOURNE & JENKIS, 2013).

Additionally, this broad vision about organizational committed which is closely related to engagement, Meyer and Allen (1991) identify, in their three-dimensional model, three bases: a) Continuance - refers to the commitment that stems from the recognition of the costs of that stems from the recognition of the costs of leaving the organization. It refers to a situation in which individuals stay because they need to; b) Affective - applies to the commitment that commitment that results from an affective bond in relation to the organization, with the subject identifying and involving himself/herself with it. In this situation, the worker stays in the organization because he/she wants to; and c) Normative - when the commitment reflects a feeling of obligation of the subject to stay in the organization. This bond is constituted by a set of thoughts in which moral obligations and moral duties to the organization, which are accompanied or coated with feelings of guilt, discomfort, apprehension and concern when the workers think or their disengagement´s plans.

Despite the large list of research that has been focusing on defining commitment, engagement and belonginess , the approaches in use do not converge toward a single concept. On the other hand, there is an exhausted list of conceptualizations in a way of measuring these constructs (MEYER & ALLEN, 1991). However, these analyses have ben conveying into the sense of organizational permanence where desirable worker´s wishes and variables are presented. These variables compound a relationship patterns and standards that forge the "right" organizational behaviors once more (BASTOS, 2014) and (SCOTT, 1995).

From now on, the researches agenda presuming that there are a couple of weaknesses under these concepts had made efforts to achieve a better delimitation of organizational commitment as mentioned by Bastos (2014). Thus, researchers identified that it must move an opposite side in order to take out the concepts what are not included (exclusionary approach) (OSIGWEH, 1989). Against to this background, Rodrigues (2009) presented a new approach where the organizational entrenchment appeared from the career´s researches field and fit it under the organizational lenses. She argues that organizational commitment and organizational entrenchment have the same basis and they are referred to under the same social phenomena.

Based on the results and findings from this organizational commitment research journey and the relevance of their foundations, Bastos (2014) proposed the resumption of a more restricted definition of the construct, which is once again understood therefore, from a unidimensional perspective, in which only the affective base is considered as part of the essence of the construct.

At the end, Commitment is not related to the employee´s permanence needs, duties or other type of obligations. It is not related to the sense of losses or personal sacrifices related to the years of services. It is not the fear of losing the jobs in case of changes neither (SILVA R. C., 2015). These emotional and non-emotional factors are closely linked the relationship established between workers and companies based on their commitment to achieve their personal, professional and business goals until it breaks by new routes that begin distancing themselves due to organizational changes (new operating model, new structures, merger and acquisitions) and personal-professional changes (social-biological cycles; economic and political changes) (BELLE, BURLEY, & LONG, 2014) and (IMMERGUT, 2007).

As previous discussed, small Assertiveness Cultures prefer collectivism instead of individualism where obedience conformity and non-cooperativity are also avoided (HOFESTEDE, 1983) and (HOUSE, DORFMAN, JAVIDAN, HANGES, & LUQUE, 2013). Therefore, it is still reasonable that employees from large Assertiveness company´s culture would also rather using cooperative relationship, increasing their sense of belonging which impacts significantly positive the people engagement. Thus, the following hypothesis was tested:

H3: There is a significant reverse correlation between Assertiveness and Engagement (employees from a smaller Assertiveness Company´s culture are more likely engaged than employees from large Assertiveness Cultures).

On top of having a large Assertiveness Cultures, there are other aspects that boost the employee´s sense of belongingness level. In fact, Collectivism likely impacts on the organizational engagement, protecting their belongings under a stable work environmental.

Goals and target designed to be achieved by groups, preserve the individual for a long term journey, having them completely tied to the group and social wellbeing (BAKKER & DEMEROUTI, 2009); (BREWER & VENAIK, 2010) and (REALO, ALLIK, & GREENFIELD, 2008). Then, the last hypothesis was tested:

H4: There is a significant direct correlation between Collectivism and Engagement (employees from large Collectivism Company´s culture are more likely engaged than employees from large Individualism Cultures).

2.4. THESIS OVERVIEW

This research proposes a new feature approach related to informal rules and organizations. It explains the informality dynamic involving an ontologically flexible approach and employing a cross –country organizational performative mindset which identifies the informalities impact significantly the engagement employee rate levels and their impacts at the organizational levels.

From the theoretical standpoint, there are contributions that come from where it analyses the question of whether geographies or institutions is the most deep determinant of economic development, considering that informal institutions are modelled as a deep determinant rather than the formal processes already stablished on the regular basis (ACEMOGLU, JOHNSON, & ROSBISON , 2001); (RODRIK, SUBRAMANIAN , & TREBBI, 2004) and (OLSSON &

HIBBS, 2005). On the other hand, from a practical standpoint, it is expected an overcoming of multilevel movements from the micro to macro management processes, especially on the informality dynamics on different approaches cross-countries. From the procedure's standpoint, constructs and their relationships are measured using the methodological processes identified as Appendix C. On top of that, the research blows up on operating the business day by day. Annually, the company where the researcher works runs an annual engagement survey which is standardized by 12 questions without considering the local and countries nuances. Despite having the results break down location by location, the analysis conduct generalizes the main results which impacts significantly the People Management approaches. More than 18 countries and 19K employees are involved in these processes, working in their mother countries or working across the regions, which will be described further on the methods.

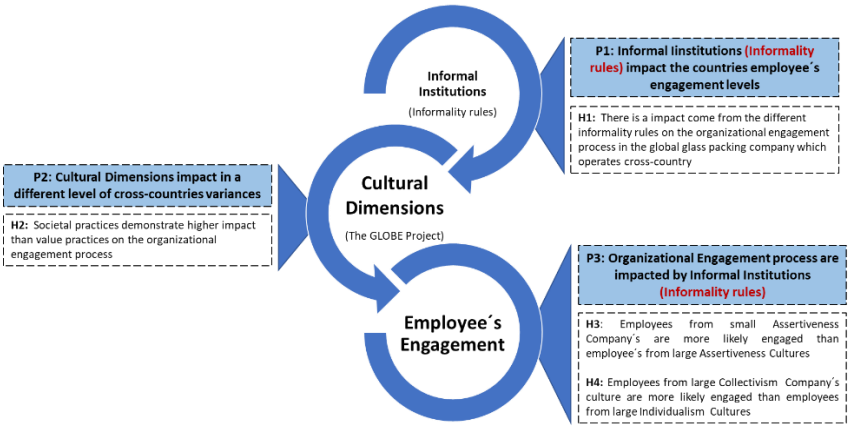

As previously discussed, the informal institutions emphasized by the literature review are a similar notion on how people interact which emerges the culture perspective as a proxy. As there are a large spectrum on the culture – informality review this thesis focused its analyses under the two most commons pillar at the international companies levels (power of distance and individualism- collectivism) (OETZEL & TING-TOOMEY, 2004); (BASABE, et al., 2002) and (SACHS, 2003).

Indeed, the research problem was already announced at the introduction background as how to understand the impact of the different informality rules on the organizational engagement processes in the global glass packaging market and their cross-country variances.

On that way, the thesis are being presented as: The institutions forge a local informal workplace where institutional field are designed by their own rules that primarily impact the employee´s engagement rates on different ways due to the cross-countries variances.

Starting from the micro to macro level, the research proposal model presented by Figure 5, has been instigating to analyses the impact of informal institutions on the organizational engagement processes. The Figure emphasizes the constructs' relationships and their influences across the model.

FIGURE 5- Research Proposal Model

Source: author, based on (FELDMAN & PENTLAND, 2003); (HODGSON, 2015); (SCOTT, 1995); (HOFSTEDE G. , 2003); (HOUSE, DORFMAN, JAVIDAN, HANGES, & LUQUE, 2013) (DIMAGGIO & POWELL, 1983); (MEYER & ROWAN, 1977); (SOLINGER, 2008).

Following this theoretical approach, the research proposal defines the first preposition to be checked during the execution process to identify how the companies at the daily basis define informal rules and processes in order to adapt the formal procedures. This approach is

supported by Hofstede (2003), House (2013) and Javidan and House (2001) that assume that the national culture is the imperative which impacts the institutions dynamics at the micro level. Each individual has a pattern of thoughts, potential actions, feelings, which are acquired in the society in which they belong, through continuous learning and these patterns can be called mental programming, which partially determine their behavior. They identified as the refinement of the mind, that is, education, art and literature, culture in the narrow sense and the second step as the collective mental programming related to a collective phenomenon, which is shared by people living in the same environment distinguishing one group from the other (HOFSTEDE G. , 1980), (HOUSE, DORFMAN, JAVIDAN, HANGES, & LUQUE, 2013), (OLLIER-MALATERRE & FOUCREAULT, 2018).

However, the entire process of institutionalizing beliefs and values in the light of normalization and cognition takes place at various levels of analysis of the institutions. DiMaggio (1988) and Powell (1991) add that such a process occurs at interpersonal and intra-organizational levels based on the elements and institutional arguments that respond to agency issues in organizational studies. On the other hand, for Scott and Meyer (1994), it is in the social and cultural influences, the amplitude that affects the organizational life and the political and ideological aspects of the social life. It is here based on rationalization (scientific, cultural and ideological), the expansion of possibilities in the needs of organizations to expand and transform.

As the spectrum of the Hofstede´s and the GLOBE Project´s research touch basis in a large of the countries and companies culture characteristics, 2 of the 6/9 dimensions were chosen in a way of analyzing their impacts in an employee´s engagement levels. Although there is

independence of the dimensions in their bipolarities, it is possible to identify standards of comparisons (CHANG, 2003) . Table 03 (on Session 2) seeks to characterize the differences between the 4 (four) main cultural dimensions of Hofstede. For those 4 criticism points suffered, this thesis approaches its research to deep dive into one of the bipolarities fully related to the emotional and rational connection between employees and their organization. This bipolarity covers Assertiveness (AST) and Collectivism-Individualism (IVC) binomial aspects.

According to House (2013), respect and formal deference to authority (e.g., elders) is valued in large-AST cultures. This deference is expressed by maintaining a significant emotional distance separating individuals of different status groups such as subordinates from superiors (BASABE, et al., 2002). Despite social norms to keep emotions under control, findings show that people from large-AST cultures also have a low affect and low emotionally engagement with the companies (OETZEL & TING-TOOMEY, 2004). Employees feel connected to their organizations when the sense of belonging is activated. These relationships have been stablished beyond to the employee´s routines. It connects throughout employee´s emotionally engagement which represents better organizational results (BELLE, BURLEY, & LONG, 2014)

Stepping back to the second preposition which deepens the hypothesis where Institutions depend on people interactions and beliefs shared that redefine rules to reestablish the order. The research is focused in those interactions between informal institutions and their mostly connection (employees-organizations and Societal – value practices) . Based on methodological individualism, this new institutionalism relativizes instrumental rationality and understands that institutions are driving and stabilizing forces. March and Olsen (1989) reinforce the importance

of institutions as agents that manipulate the interests and preferences of individuals and their relationships under the conditions in which they present themselves. In this sense, Scott (2008) counterpoints to the extent that he considers the role of values as central from the old institutionalism to the new institutionalism in the orientation of cognitive processes.

Henceforth, the thesis assumes that Informal institutions impact on the employee`s engagement levels since the binomial approach found at the shop to top floor is an opposite way which means large Assertiveness rates and small Collectivism rates. This is the statement which covers the **prepositions 03** break down in 2 others hypothesis already previous detailed (**H3 and H4**)

As one of the most emerging challenges in the business and academic´s agendas today, employee´s engagement is an area of concerns, stretching organizations on developing new guidelines across the entire Strategic People Agenda. There are aspects positively impacted by the high engagement rates such as low levels of absenteeism and turn over, high level of organizational loyalties, productivity improvements indicators, overall satisfaction where the emotional and intellectual commitment boots the organizational tangible and intangible results (BELLE, BURLEY, & LONG, 2014).

The nuclear center of the engagement resides on the emotional and rational perspective, considering the advantage of remaining versus nonutility of leaving, these costs are completely associated on how employees are feeling tied to the organizations (ALLEN, 2016); (BANSAL, 2003); (BELLE, BURLEY, & LONG, 2014); (CARVALHO, 2011); (COCKSHAW & SHOCHET, 2014); (FARNDALE & MURRER, 2015) and (KANTER, 1968). Here is the

primary argument which establishes a close connection between engagement and institutionalism and provoke the **preposition 1** formulation. The research believes that high engagement rate levels drives to high connection rate levels also. Then, Employees with high level of engagement are more likely tied to the organization than fully disengaged employees (**H3 and H4**)

3 - METHOD

3.1. STUDY AREA DESCRIPTION

This thesis is based on its investigation under multiple areas of knowledge. The main area focus on how the intuitions have been forging the individual´s behaviors. Inferring that organizations as the principal agent in the society which establishes the acceptable individual´s behaviors, define procedures, routines, and rewards to achieve their own goals, framing their employees (HALL & TAYLOR, 2003). The majority of researches available in that field, most of the authors identify the prevalence of the company´s systems and symbols that have been reinforce the worker´s behaviors in a way to reduce conflicts and support their sense of belonging (SCOTT, 1995).

Although, the Institutionalism authors such as Powell (1995); Powell and DiMaggio (1991); Scott (1995); Hall and Taylor (2003); Aldrich and Reuf (2006); Feldman and Pentland (2003); Immergut (2007) and Hodgson (2015) have been defined Institution is a term frequently used to determine such as mechanisms which govern the behavior of a set of collective interactions within a community delimited in a boundaries well defined. Institutions are ubiquitous in a way that it is a simple description of who human beings are or what they do would be very difficult if they could not use institutional terms. Since our behavior is constantly influenced by institutional entities and institutional roles, institutions have always been a central topic of research in the social sciences. But institutions are also called philosophic for a variety of reasons. Institutions are peculiar products of human activities, to begin with, and may hold the key to understanding our special place in the natural world. This evidence supports science

perspective that humans are animals who can build diverse social organizations and who constantly invent new ways of living together.

3.2. RESEARCH DESIGN

As previously discussed, the research proposes understanding the impacts that come from informal institutions on the decision-making process in the Global Glass Packaging Market. From now on, the proposal defined two main prepositions presented in the last chapter that combine three constructs: formal institutions, informal institutions and engagement process classified in that perspective as a social dilemma.

Before co-relating the impacts on the constructs, a literature review was conducted to understand and clarifies the exact approaches and definitions covered across the entire research process. This review was conducted based on 5 years backlog on the main academic and publications vehicles. Considering that scientist don´t ever work isolated, aligned with the literature review, a bibliometric review was covered at the same period (SURAMANYAM , 1983). It is relevant to understand that there is no brand-new investigation without using prior knowledge. The academic takes place its progress in a knowledge journey process.

Following the two first steps, these methods facilitated the investigation of their relationships between research collaboration and variables pertaining to research problems and research environment. These processes supported the thesis to be more relevant at the academic and business levels (SURAMANYAM , 1983). The multiple authored papers usually accelerate the

research process, helping the researchers convey in the right areas of knowledge and their approaches, filling the blank areas.

Proceeding the proposal, the research followed a inductive process, starting on a finding that the decision making process are usually impacted by the micro level between the force arena where the agencies and companies discussing and putting place the understanding of norms and procedures established.

TABLE 4 - Variance theory versus process theory

Variance Theory	*Process Theory*
The basis of explanation is causality. 1. The precursor (X) is a necessary and sufficient condition for the outcome (Y). 2. A variance theory deals with variables. 3. A variance theory deals with efficient causes. 4. In variance theory, time ordering among the contributing (independent) variables is immaterial to the outcome.	The basis of explanation is probabilistic rearrangement. 1. The precursor (X) is a necessary condition for the outcome (Y). 2. A process theory deals with discrete states and events. 3. A process theory deals with a final cause. 4. In process theory, time ordering among the contributing events is generally critical for the outcome.

Source: (MOHR, 1982)

As explained by Table 4 – Variance and process approaches, this proposal covered for taking a look by variance to explain culture and decision-making processes. However, during the knowledge journey, it probably requires making use other methods which will be analyzed step by step (MOHR, 1982). Considering that, the variance approach helps to understand these

constructs and their relationships, it requires different methods. First, a qualitative method was used to understand the habitus inside the mindset already crystalized in the regulatory agencies. It will be looking for the beliefs and values stuck on that provoke those reactions into the system that delays the time to market processes. Explained by the sociology institutionalism, developed under the Politic Science, there are routines, procedures and social life standards that were developed under such culture trends. That´s the reason the previous experience impacts significantly on how the actors interpret their own worlds (IMMERGUT, 2007). Although it is recognized that there is a rationality of human behavior, as previously mentioned, there is a pattern of behavior adopted by individuals (HALL & TAYLOR, 2003). Proceeding the qualitative methods, the companies will be listened to in terms of identifying convergences and divergences. There is a standard as norm or procedures that would be identified and tracked during the interviews which could be classified as an Institutional Corporatism to protect the countries citizens despite of accelerating the clinical tests and their innovation processes at the country levels.

However, an investigation was conducted in parallel, where a survey was ran in the biggest worldwide glass packaging company across the several countries. This survey was based on the Organizational Engagement Model proposed by Meyer & Allen (1991); Mowday et.al (1982) and Farndale & Murrer (2015).

The research design was defined based on the qualitative methods procedures. Since the data came from an operational database mainly based on engagement surveys and internal meta-data of the company to address each survey answer to a country, an experimental design should not

be ideal under those limitations. Therefore, the grouping was conducted by country as the other information were not available (such as age, gender, years of service, etc). On the other hand, following the anonymity criteria, the analysis incorporated all the data available at the country group level; without answers replicated; incomplete data (no missing values) which conveys adequate answers 'quality.

After consolidating the result data from its original source, two analysis procedures were conducted based on the data granularity available. Both procedures assumes 95% of confidence level. The first analysis procedure used data from the engagement survey per se, where the granularity is on answer level (same as individual level, because there is only one answer for each person). Indeed, in case of testing H1, the method used was an ANOVA applicable to the general problem. Then, a post-hoc complete test was conducted and it is full presented in the Appendix, combining country by country..

The second procedure uses data from the globe leadership project survey and engagement survey together with a country level granularity. The H2 testing was conducted by ANOVA multiple variable regression model, where all the engagement survey answers broke down by country was tested in comparison to each Societal and Value Practices survey variable available. As the result of this test conducted, numbers of significant coefficient correlations were observed, proving and additional grouping separated by the main pillars (Societal and Values Practices).

Following the hypothesis tests, the H3 and H4 were analyzed by the same approach conducted to check the H2. However, in this two cases, the directly or reversely correlation must be observed when the regression model was ran. The strong correlation level was illustrated by the p-value presented in the Appendix while the trends were demonstrated under the scatterplot graphs plotted (axis is the standardized Societal Practices average and X axis is the standardized engagement average)

Positivism or Negativism overall trend (H2, H3, H4) were mitigated as the difference between the original average and overall average were used instead of capturing the simple average result by country. Indeed, the results would have been impacted by other variables came from demographics since the hypothesis tests focused on the relationship between Societal Practices and Engagement Results instead of groups or country local nuances.

Finally, as soon as all the information was collected, a cross-check analysis was conducted. More than supporting and justifying the prepositions and their hypothesis, this investigation and evaluation look for patterns at local and global levels. The sociology institutionalism understands that there is a kind of universalism around the institutions around how they think about their relationships which moves beyond of the norms and procedures defined. It includes system of symbols and beliefs that directly impact the human behaviors at the social levels (HALL & TAYLOR, 2003).

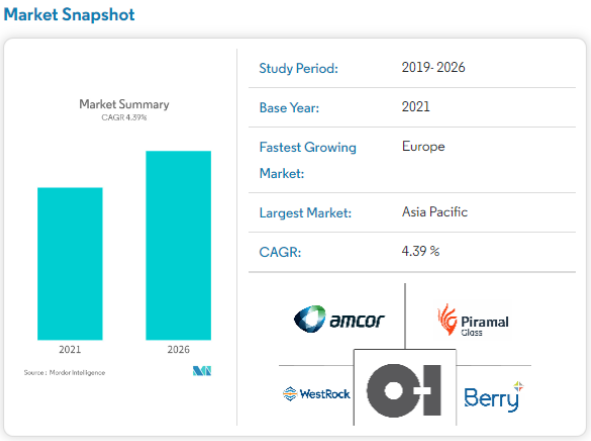

3.3. SAMPLING STRATEGY

After conducting a theoretical background review conducted on 5 years backlog on the main academic and publications vehicles the prepositions and hypothesis were refined in order to analyses the impact of the informal rules on the engagement company levels.

The industrial sector selected to run the research was the Glass Packaging Market. The global glass packaging, which was estimated at USD 56.64 billion in 2002, it is expected to register a CAGR of 4,39% to reach USD 73.29 billion by 2026 - presented by Figure 6. As considering with one of the most trusted packaging, this is an industrial sector which keeps growing despite the heavy competition (Mordor Intelligence, 2022).

The strong presence of major players worldwide, the global packaging market is highly competitive intense by the strong substitute´s presence. This market share has been dominated by 05 big players: PGP - Piramal Glass Private Limited, Owens Illinois Inc., Amcor Plc, Berry Global Inc. and Westpack LLC. As one of the leaders on the industrial sector, the PGP was not considered in that analyses due to its primary presence at India & Asia / Pacific. On the other hand, the thesis was conducted at one of the Leading Glass Bottle Manufacturing Worldwide Company which has the representative market share and considerable number of workers across the globe, located on 5 continents. Even though the other players listed above are composed by a large number of workers, they are not exclusively operating in the glass packaging market that can probably impact positively or negatively on the thesis results. That´s the reason they are considered in the scope as well.

FIGURE 6- Glass Packaging Market Snapshot

Source: (Mordor Intelligence, 2022)

As previous mentioned, the Glass manufacturing sector were selected considered its impact in terms of economy and employment rates across the globe. Diving into the segment, company where the researched was conducted is one of the biggest worldwide glass manufacturing company across the globe with a representative the market share as mentioned.

Henceforth, there is a discussion topic related to the scope regarding selecting just one organization. Apart to the organization relevance in terms of market share and number of employees, the universe of data defined inside only one organization must be outlined in following comparative research, which data universe must be collected on similar organizations that operate globally, with a large set of facilities located in different countries as well as the one presented in this thesis, to mitigate interferences that come from non-standardized People Management practices cross-countries.

3.4. ETL (EXTRACT, TRANSFORM AND LOAD) PROCEDURE

This research was analyzed by Extract, transform, and load (ETL). It is the process of combining data from multiple sources into a large, central repository called a data warehouse. ETL uses a set of business rules to clean and organize raw data and prepare it for storage, data analytics, and machine learning (MLS) (REDDY & JENA, 2010). The data analyzed came from two master tables with different levels of granularity. Therefore, a data quality data procedure was applied and described step by step as following in order to support that the process should be replicated (WESTBROOK, 1994).

The main data source contained the individual employee´s answers for the engagement 13 questions survey (described in Appendix A). It was extracted from the company data source used to build an heatmap data visualization tool. Then, the extract process was done by the company tools and the raw data was presented in tabular format as a single spreadsheet. The raw database was organized by each employee´s responses, their 13 questions and their country group. Each response is an integer number in a 5-point Likert scale (except for the first question which is an overall satisfaction scale, but have the same variation and data format of all other). The scale measure the employee´s agreement about the affirmatives from (1) fully disagree to (5) fully agree that represent the employee´s engagement rates.

As the original data source was composed by 19976 lines which represents all the respondents, the cleaning database was conducted (outliers, duplicated lines and replication were removed) based on the following 5 steps (MAYFIELD, NEVILLE, & PRABHAKAR, 2018).

Step 1: Verify if data is well formatted, and within range, inside cells: after reviewing, only 4 lines were spurious answers that were removed. No other inconsistency was identified (all format and answers were presenting right format and accuracy. The new database considered was 19972. **Step 2:** Check for missing data (cell with no answers): 24 empty cells were removed in different country blocks probably caused by mis extracting process. After adjusting, the sampling was 19948 (HELLERSTEIN, 2008).

Step 3: Create new variables and choose a proper heading to name each one: This step does not change the number of database lines , but it adds some columns and a header, the first new column is the overall mean for each country (this is an aggregated data and could be put only on the aggregate source, it is put here to make the table ready for analysis without the need to join data from any other table). The new 13 columns were calculated by subtracting the country mean for each answer to the answer itself, while preserving the original answers on the master table. These new variables could be used on the tests instead of direct answers, to mitigate the positivism country bias, that could not be addressed otherwise since no other data exists on the same granularity (STAVROUDIS, DOHERTY, & WOLBERS, 2005)

Step 4: Identifying replication patterns and removing duplicated lines: Since there is no formal key to the data after extraction, there could be duplicates on the source since the extraction process is not controlled, to check this a search is performed for exact same answers, for an entire line, inside each country, and to check if those replicas follow some repetition pattern. Since there is no true key for this table, some replicas are expected to happen, and for this reason there is a need to have a strategy to identify and remove them, on a controlled experimental

design this step should be dealt with on the planning and anonymization process. Following a strict rule to deal with possible replicas, all the identified patterns are eliminated, keeping only one block for each country, this step cuts a massive quantity of lines, but the number of remaining lines is more than enough for the analytical tool and hypothesis tests that will follow. After all replica lines were removed, the N was reduced to 3723 (HIROSE & CRESWELL, 2023).

Step 5: Answers by country size requisites and outlier removal by diversity of answers: After conducting the the quality of data transformations, there is also 3 criteria that must be followed before testing all hypothesis. First of is related to the Criteria on size: Each country must have at least the size N=30 after all other transformations are performed, this is a minimum group size to guarantee enough statistical power. Criteria of presence for linkage: Each country must be present, at least as a part, on engagement survey, to enable the full linkage to be done without missing values. Criteria of outlier by diversity of answers: Each country must have at least 3 of the 5 possible answers on the Likert scale present, for each of the questions. With only 2 answers on the Likert scale this could compromises the question as a scale, for this reason the questions should be revised and it is not a possibility on a non-experimental design, if this is observed the answers for those countries should be put aside as outliers. After those transformations and filters by criteria are performed, the final size N is reduced to 3226 (HIROSE & CRESWELL, 2023).

After completing all ETL procedure steps, the data (N=3226) were loaded with granularity for preserving the engagement survey responses. All the hypothesis were tested under a integer

repository saved on analytical software format (SPSS - Statistical Package for the Social Sciences)

3.5. STATISTICAL HYPOTHESIS TESTING

The hypothesis H1 was tested by running the ANOVA (95% confidence level), comparing variances across the average of difference between countries relative to the engagement survey responses. At the beginning, each question from the engagement survey must be defined as a dependent variable (ANOVA). Then the country was defined as a factor to separate the groups and compare the questionnaire answer means between all groups. If for each question, the p-value of the analysis is below 0,05, it means that the null hypothesis, that there is no difference between any country, should be rejected, so the hypothesis that at least one country is different cannot be rejected, this analysis will be referred as direct H1 test (ROUDER, SCHUERCH, & MOREY, 2022).

On all methods and tests, the assumptions applied for the ANOVA are presented as following:

Assumption 1: All dependent variables should be a continuous scale, since those are a 5-point Likert scale, a mean, or a combination of both, this assumption is secured for all tests. Assumption 2: The independent variables should be formed of at least two independent groups, since the test groups are different countries, this assumption is assured. Assumption 3: There must be independence of observations, since all respondents are member of one and only one group (a country), there is no replicated answer in more than one group, not even inside the same groups, so this assumption is also assured. For this reason, step 4 of the ETL process was

rigorously enforced, after this step all possible replicas are eliminated from the data source (TAN, 2023).

Assumption 4: There should be no significant outliers, this assumption is assured by following the criteria of outlier by diversity of answers on step 5 of the ETL, this way the scale outliers could be eliminated from the data source, so this assumption is assured for the data that remains. Assumption 5: The dependent variables should be close to a normal distribution for each group defined by the independent variable, since the dependent variables are Likert scales or means of such scales, this assumption is assured. Assumption 6: The homogeneity of variances should be tested, for this the Levene test should be performed, and on refuting the test null hypothesis the homogeneity of variances could not be assured, if this happens, a proper post-hoc test should be performed, also a Welch ANOVA test can be performed to check if the general results remain (TAN, 2023).

After testing for H1 with answers where the Likert scale varies from 1 to 5 directly, the same ANOVA model will be replicated for the answers minus the overall answers mean for each country, as the metric is group means to be compared, this transformation attenuates the possible bias when a country may have a general positivity or negativity on answering all questions, the same confidence level of 95% and possible conclusions about H1 will be shown, if using this method the conclusions are the same from the direct H1 test, then the differences could not be completely explained by a country positivity answering standard.

After all the general tests are performed, it is interesting to go further and explore pairwise relation between groups, since the N is robust for such analysis, so for each pair of countries a Lavene test, at 95% confidence level, will be performed to check for homogeneity of variances, in this test, the null hypothesis states that the group variances are homogenous, so if it is refuted (p-value below 0,05) the homogeneity could not be assumed, this result is needed for the post-hoc ANOVA tests to check for pairwise differences between countries, since the post-hoc model to be used must assume homogeneity or not. For the post-hoc test if the Lavene tests null hypothesis is rejected, the Games-Howell test should be used, if the Lavene test null hypothesis could not be rejected, then the Bonferroni test should be used, since there are many groups (N groups = 18), and their size differs (ZULENI, 2023).

Since the post-hoc test results are huge, the number of possible pairwise for 18 groups totals 306 different combinations, those results will be presented in Appendix E, for both the direct H1 tests and the modified H1 tests, those results complement the H1 argument as it explains exactly what the differences between countries are, for the H1 argument any of such difference is enough.

The hypothesis H2 was tested under comparing the independent variables from the engagement survey, ran and its results extracted in 2022 with an aggregated small sampling size (N18) broken down country. This design a single linear model was used to check for correlations between the answers average modified from the means of H1 as the comparative basis.

The engagement survey has itself 2 great groups of answers, one for societal values, and other for societal practices, so to test for H2 the linear regression each of the questions on the engagement survey will be used as a single dependent variable, and all of the answers of the engagement survey will be used as independent variables, using an ANOVA to test overall correlation and coefficient correlations.

On independent variables, linear combination answers was excluded (as the first question which measures the overall satisfaction). The main results were considered the p-values coefficients for each question came from the engagement survey. This procedure was repeated for all survey questions, checking the number of such pairwise correlations for each of the two groups of engagement survey questions (societal values questions, and societal practices questions). For these results, since the size of the data is small because it is an aggregated source, he confidence level could be reduced to 90% and categorize those results as middle evidence for correlation, and to 80% for weak evidence for correlation. The numbers of coefficient correlations must be strong (95% confidence level) while the H2 was being tested for least one of the questions (engagement survey) in comparison of the great groups (societal or value practices) (WESTBROOK, 1994).

H3 and H4 are hypothesis built after the H2 tests as a further understanding of the results. The designing tests was the same as applied in the H2 approach. However, all of the pairwise relations between questions were not only presented as an overall count, but also, as the scatterplots for Assertiveness practices plotted against all engagement questions. All pairwise ANOVA scatterplots and the general regression model, between engagement survey by country, are presented in Appendix F for any reference.

3.6. CONVERGENT AND DISCRIMINANT VALIDY TESTIING

The engagement construct observed across the research under the Gallup Q12 questionnaire was validated by a Convergent and Discriminant Validity Testing. As the countries engagement results measured and came from the same construct the convergent testing was performed in order to identify if there is a strong positive correlation between the results which means that a high convergent validity is considered (CABLE & DeRUE, 2002).

In the other hand, the discriminant validity was analyzed by comparing the results of an assessment that measures one thing with those of a test that measures something else altogether. If there is no correlation between the scores, the test can be said to have high discriminant validity; a strong correlation would indicate low discriminant validity (STOSIC, FULTZ, BROWN , & BERNIERI, 2022).

In general terms, the Gallup Q12 Validity Testing, under the sampling available, was conducted in two main directions, as following: 1) Convergent Validity Testing measured the convergent between group of countries which analyzed as much the Q12 converge to the same result as they are ranked by countries and 2) Discriminant Validity Testing was measured to evaluate if it would be validated, having the data break down by country.

Before starting the Convergent and Discriminant Validity Testing, It recommends to proceed a formal questionnaire validation process in terms of excluding respondents potential bias before

running the validity testing per se (CABLE & DeRUE, 2002). In case of the Gallup Q12, the demographics (gender, ages, areas, department, layers, etc) would be helpful to reduce these elements. However, preserving the respondent confidentially and considering that the Gallup Q12 has been running for so many years in a large numbers of worldwide companies, the tests were proceeded, reinforcing its replication potential instead of criticizing the lack of data as it assumed not all criteria are needed enough to attend these procedures guidelines which reduces significantly risks or criticism about testing results and their analyses.

An additional methodology topic to be considered is related to the database source. It came directly from the company after performing a ETL process without any researcher control. Potentially, the raw database would be required to confirm the engagement research tool. However, as the respondent ID is not needed in that case, procedures related to overall remove process and PII procedures should run as applicable.

Finally, the last method topic to be observed is about there is no missing data available in The 5-point Likert scale. It confirms that the normal representative curves projected reflect the supposed regular distribution. However, no one "1" answer was observed caused by current employees responses or additional ETL procedure performed by the company before sharing the data. Indeed, the criticism would support new researches instead of impacting the following method processes applied and results. Additionally, Social and Economic variables could impact the Gallup Q12 engagement survey across the years. These impacts must be considered before getting final conclusions and data validation at all.

After reviewing this method topics and aware that the Convergent and Discriminant Validity Testing is a complementary procedures for this thesis after many analysis completed, there some criteria proposed were followed. The Convergent Validity Testing was measure by the Cronbach's alpha coefficient. The coefficient consistency was defined as 0.7 or higher which indicates acceptable internal consistency (STOSIC, FULTZ, BROWN , & BERNIERI, 2022). On the other hand, the Discriminant Validity Testing was measured by ANOVA. The partial results were analyzed against the countries average results, observing the consistency ranges, having the discriminant countries index by questions (p-value ≥ 0.05).Two main outputs were expected: Values above 0% for all questions and, One question which would discriminate one country to the other at least.

04 – RESULTS AND DISCUSSIONS

As the thesis proposed identifying the impact of the informality rules on the organizational engagement, four hypotheses were formulated as tested. Based on the methods previous discussed, the analysis as following proceeded testing the main country impacts on the results, then the societal practices and values intensity impacts were evaluated to correlate these practices and the organizational engagement focused on Assertiveness and Collectivism. Please, see the four hypothesis test results as following:

4.1. HYPOTHESIS 1: Significant differences between countries can be observed. Those differences cannot be explained only by a general positivity or negativity for each country.

The differences between countries answers for each engagement survey questions were analyzed as running the ANOVA based on the method previous described. All the results are being presented on Table 05 - ANOVA to test direct H1, modified H1 and Welch test. The Welch parameter F is an extra data presented as a complementary measure and the p-value reinforce the 95% confidence level. This p-value rejected the null hypothesis for Direct and Modified H1 tests, indicating a very strong results (all Welch p-values < 0,001)

The parameters F for normal ANOVA and for Welch ANOVA presented on table 5, show that some differences can be observed for the questions. Higher F values indicates that the means variation between groups are higher than the variation inside groups. These differences may better explained by the clusters reorganized by the analysis between 18 countries without

internal differences themselves. It suggests there is not the case impacted by Gallup´s Q12 Survey. However, a post-hoc test was performed (as presented in the Appendix E) to check each potential comparison between all countries. Finally, findings highlighted the large number of results, showing that the differences between countries are not homogeneous for particular country clusters or questions.

The p-values states that both direct and modified H1 tests rejected the null hypothesis at 95% confidence for every question of the engagement survey. Welch F also rejected the homogeneity of variances was being tested and was rejected (as shown in Table 7 – Levene test for homogeneity of variance on both direct H1 and modified H1 tests). Indeed, Welch ANOVA the results corroborates with the usual ANOVA tests and null hypothesis were rejected for all questions.

TABLE 6 - Levene test for homogeneity of variance on both direct H1 and modified H1 tests (95% confidence).

Finally, the post-hoc tests results are presented in the Table 07 (Post-hot Bonferroni ANOVA test p-values and number of pairwise differences between Brazil and other countries). Based on Bonferroni post-hoc ANOVA method, Brazil is paired in comparison with other countries. Results present a large numbers of significancy where p-values found are below than 0,05. These results corroborate with previous results that there are heterogeneous results both on countries and questions. The differences are not explained only by a few questions or countries being the source of the all difference. Only, the inter connection analysis indicates that H1 null hypothesis should be rejected and that country is a significant variable to be observed on engagement surveys since a difference between countries can be observed on every question present on the survey.

TABLE 7 - Post-hoc Bonferroni ANOVA p-values and number of differences between Brazil and other 17 countries for the engagement survey on modified H1 test (95% confidence).

The results presented on Table 8 use the modified H1 test which means that an overall country positivity and negativity was attenuated. All other pairwise comparison between any 2 countries, as well as all comparisons using unmodified answers can be found on Appendix D. It replicates this method for the same pairwise countries without attenuating the general positivity effect. The results are more evident as there are more differences, but not concentrated on all the same questions or countries, as it can be seen on Table 8 - Post-hot Bonferroni ANOVA p-values and number of differences between Brazil and other 17 countries for the engagement survey on direct H1 test, on both tables significant differences can be observed.

N differences / countries	11	6	11	9	10	13	15	13	12	12	11	16	

Source: Author, based on engagement survey data with response granularity.

As expected, the significant number of pairwise differences from positivity attenuated comparisons presented on Table are fewer in number than those presented on Table 8. These are direct results (for country pairs with Brazil, 139 significant differences on direct H1 test, and 44 significant differences on modified H1 test). Nevertheless, the differences are quite enough to reject the H1 null hypothesis that there is no difference between countries.

4.2. HYPOTHESIS 2: Correlations between societal practices and the organizational engagement process can be observed, correlations between societal values and the organizational engagement process cannot be observed.

Correlations between Q12 Employee Engagement Survey (Appendix A) results and Globe Leadership Project survey (questions on Appendix B) results were tested, based on a new aggregated data table, containing 18 countries already described in the method without linkage between questions and their respondents, preserving the anonymity. This method approach considered Q12 questions as independent variables, checked against every question on the original survey as a dependent variable. ANOVA is once more performed in order to correlate p-value and also the coefficient p-values (dependent and independent variable pair) in the multivariable linear regression model.

The 95 confidence level was set for all ANOVA analysis (general and pairwise perspectives). Medium correlation index was ranked as 90% and weak correlation was defined as 80%. All the results are summarized in the Table 09 - Correlations between engagement and Societal Practices surveys.

Correlations grades are being showed in the Table 09 where there are two main strong directly and reversely correlations. A significant reverse correlation (Assertiveness) and a significant correlation (Collectivism) on engagement survey and answers on engagement survey can be observed. Digging of the details, It observes 9 (75%) country questions answers correlate strongly to the Collectivism I societal practices. On the other hand, Assertiveness reverse

strongly correlates to the 11 (92%) country answers. Both were tested under 95% confidence level. This reverse correlation means that the more positive the answer for the engagement survey is, the more negative is the answers on the engagement survey, for the country granularity degree of comparison.

TABLE 9 - Correlations between engagement and Societal and Value Practices.

Question on Globe Leader. Project N=18	ANOVA Regression p-value	Direction (3 or more strong)	N strong (95%) direct corr.	N strong (95%) reverse corr.	N medium (90%) direct corr.	N medium (90%) reverse corr.	N weak (80%) direct corr.	N weak (80%) reverse corr.

Source: Author, based on engagement survey data with country granularity.

As additional findings the correlations between engagement and Societal and Value Practices, Humane Orientation Societal practices represents the weaker correlation result when comparing to the engagement survey. There is one medium and three weak correlations with questions from the engagement survey. On top of having all of them are direct but not strong enough, the Gender Egalitarianism societal practices presents 3 weak correlations as well (reverse correlations). On societal values groups, there is only one engagement question group which presented a strong and more than 2 correlations. It was the Collectivism II with one strong direct and one weak direct, but also one medium reverse correlation which does not meet the criteria described on the method.

Accordingly, the only group that could have their null hypothesis rejected is the societal practices, where correlating with the countries questions answered . For this reason, correlations could be observed on the societal practices group, while the null hypothesis could not be rejected for the societal values group, following the method where there is a threshold of 3 or more individual strong correlations. Since the confidence level of 95% was applied for every pairwise coefficient analysis, a small number of sparse pairs of questions on engagement survey can be found to be correlated. The confidence level error margin should be considered for the 216 comparisons divided on 18 groups of 12 questions each. This statistical scenario strong considers 3 or more type 1 error on a given group of 12 questions at confidence of 95% is around 2,1% (for a detailed comparison, if it was only 2 question threshold, the value raise to 12,0% error chance which is not acceptable, so 3 question threshold is the adequate value to keep those errors controlled for this result scenario).

4.3. HYPOTHESIS 3 and 4: A significant reverse correlation between Assertiveness Societal Practices on engagement survey and answers on engagement survey can be observed, both as pairwise correlations and on general regression model. A strong direct correlation between Collectivism Societal Practices on engagement survey and answers on engagement survey can be observed, as pairwise correlations but not on the general regression model.

The correlation on details for each Q12 employee engagement survey is presented on the Table 10 - Table 10 – Assertiveness Societal Practices and engagement survey correlations by question, ANOVA linear regression model for the better understanding. As an overall result, 11 of the 12 questions of the engagement survey are correlated with the Assertiveness Societal Practices questions of the engagement survey at 95% confidence level, all of them as a reverse correlation, when comparing means by country removing a general positivity bias for every country.

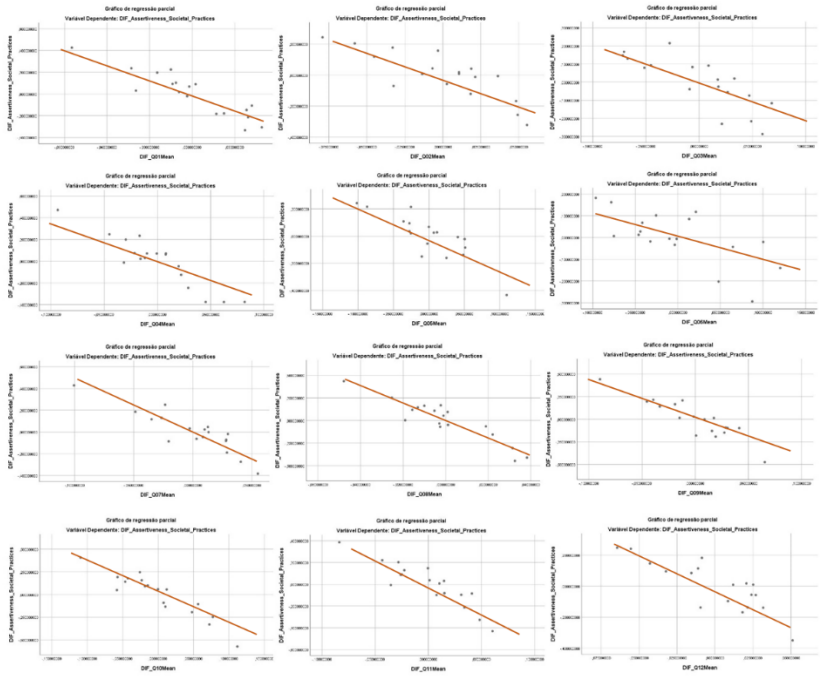

TABLE 10 - Assertiveness Societal Practices and engagement survey correlations by question, ANOVA linear regression model. (95% confidence)

Constant: B = -0.084; Constant error = 0,209: Constant t = -0,401 (p = 0.705)						

Source: Author, based on engagement and Globe Leadership Practices surveys data with country granularity.

The ANOVA linear regression model conducted (Table 10), highlighted strong relations ($p<0.05$) for all Q12 questions directly or inversely, except for Q06 (development encouragement). Then, it confirms strong reverse correlation between Assertiveness Societal Practices and Q12 Employee Engagement Survey. On top of identifying the correlations, a country level granularity are presented on Figure 7- Scatterplot of Assertiveness Societal Practices and questions on the Engagement Survey. (Y axis means standardized Assertiveness Societal Practices answer mean and X axis is the standardized mean for the engagement survey answers). The answers represents the difference from the country mean to attenuate an overall positiveness bias by country, observing those figures a linear correlation could be seen, corroborating with the linear regression model choice for this analysis.

FIGURE 7- Scatterplot of Assertiveness Societal Practices and questions on the Engagement Survey, country granularity (N = 18)

Source: Author, based on engagement and Globe Leadership Practices surveys data with country granularity.

Observing the scatterplots of Figure 7 a good fitting for a linear model can be observed as a pattern on almost all questions. The trend lines highlight strongly correlations between the engagement survey and the societal practices. The parameter t observed on the Table 10, if negative, indicates a reverse correlation, as it gets more distant from the zero, under the same model with similar variables and dimensions, the higher is the correlation strength (on the case of reverse correlations, the lower t values indicates stronger correlations).

TABLE 11 – Collectivism I Societal Practices and engagement survey correlations by question, ANOVA linear regression model. (95% confidence)

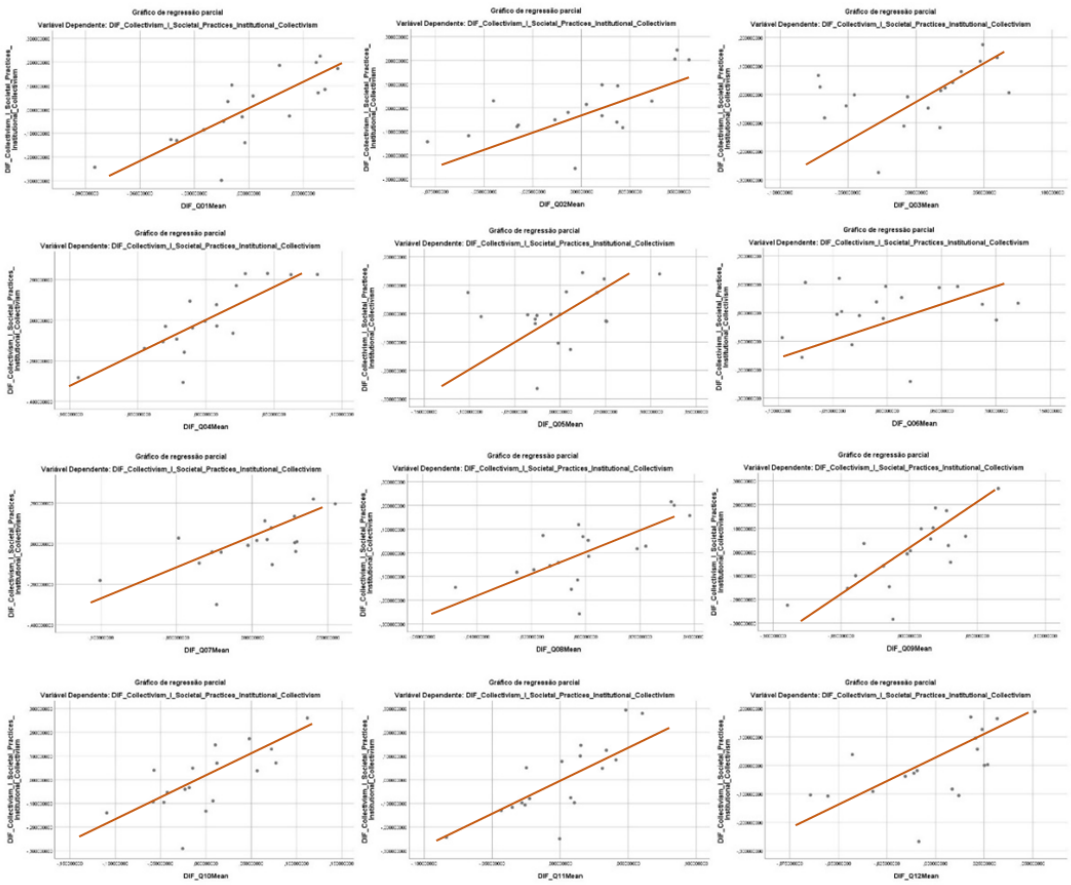

Question on engagement	Unstandardized B Coefficient	Unstandardized error	Standardized Beta	Parameter t	p-value	Direction
Q01	3.357	1.210	2.494	2.775	0.039	Direct

Q11	3.406	1.161	2.425	2.934	0.032	Direct
Q12	2.255	1.329	1.150	1.696	0.151	
Constant: B = -0.084; Constant error = 0,209: Constant t = -0,401 (p = 0.705)						

Source: Author, based on engagement and Globe Leadership Practices surveys data with country granularity.

As the previous hypothesis formulated, the strong direct correlation between Collectivism I societal practices and Q12 Employee Engagement Survey was confirmed. On top of validating the hypothesis, the questions Q1, Q4 and Q11 (structure needs; recognition and progress) are the strongest correlations observed. On the other hand, not all questions demonstrate a similar

pattern as happen in the Hypothesis H3 tested (Table 10 and Figure 07). An additional country granularity trend lines are presented on Figure 8 - Scatterplot of Collectivism I Societal Practices and questions on the Engagement Survey. The results, after running the ANOVA linear regression model could not reject the null hypothesis as a whole when comparing all the questions with the engagement survey answers. However, the null hypothesis are rejected and the pairwise are strong correlated when analysing question by question in separate, having the same trend direction lines.

FIGURE 8- Scatterplot of Collectivism I Societal Practices and questions on the Engagement Survey, country granularity (N = 18)

Source: Author, based on engagement and Globe Leadership Practices surveys data with country granularity.

On Figure 8 a clear linear fitting could be observed on the cases of Q01, Q04 and Q11, and a weaker fitting could be observed on Q02, Q07, Q08, Q09, Q10 and Q12, while others seems to have no clear pattern. The parameter t presented on the Table 11 are all positive, even for the questions where the correlation was not strong enough to reject null hypotheses at 95% confidence level. This is a direct correlation, under the similar variables and dimensions, which means that as much as the t parameter higher is higher , the stronger is the correlation.

For all other of the partial results and pairwise comparisons between Societal Practices survey groups and engagement survey questions, there is only a few sparse and weaker correlations as described on table 10, all the scatterplots, as well as all the test results could be found on the Appendix F.

4.4. CONVERGENT AND DISCRIMINANT: Validity Testing Results

As mentioned on the method topic before, the Convergent Validity Testing was measure by the Cronbach's alpha coefficient. After running the procedure under the 13 questions available the Cronbach's alpha coefficient results was 0,773 which indicates acceptable internal consistency (>0.7). Generally, it confirms that the engagement survey tool converges to a consistently result.

Source: Author, based on Convergent Validity Testing (CABLE & DeRUE, 2002) and (STOSIC, FULTZ, BROWN , & BERNIERI, 2022).

From now on, each question was analyzed under running a Pearson correlation procedure, having the results presented in the Table 12 – Engagement Survey Correlation Matrix. The parameters ranges from 1 (non-correlation) to -1 (strong correlation). No results close to zero were expected unless in the diagonal where results equal to 1 were found due to itself question comparison. The thresholds were defined as much as they were far from zero (0,8 and -0,8).

As no strong correlation was observed during the test, it means the questionnaire has a robust convergent, having all the questions with independent information, no impacted by other question from the same research tool. As presented in the Table 13 - Cronbach's alpha coefficients - excluding cases, new the Cronbach's alpha coefficients were calculated to confirm this hypothesis for all excluding cases, identifying partial results, variances and averages item by item.

TABLE 13 – Cronbach's alpha coefficients - excluding cases

q10	196	64,1%
q11	136	44,4%
q12	72	23,5%

Source: Author, based on Discriminant Validity Testing (CABLE & DeRUE, 2002) and (STOSIC, FULTZ, BROWN , & BERNIERI, 2022).

The Discriminant Validity Testing was performed by ANOVA as presented in the Table 14 - Discriminant Validity Testing – ANOVA Approach. Partial ANOVA Test Results and Games-Howell post-hoc were measured in order to identify if each question determines one countries related to the other countries. Pairs analysis (18 countries and 306 pairs) were considered as the determinant value. So, the results presents the numbers of each question was well success in separate its country pair (p-value >= 0.05) and the percentage of pairs whose question is able to proceed this separation. Values close to zero were not expected and it was confirmed under the 8% of question threshold for its discrimination

The results concluded that the engagement survey is composed by questions where all of them are able to discriminate countries in a such level of acceptable data as the same time that part of the questions presented quite higher potential well success level than others (max q10: best friend 64.1% and min q06: development encouragement - 14,4%).

05 – FINAL REMARKS

This research was designed under a quantitative approach to answers questions about the relevance or influence of different informality rules, grouped by country granularity, and the impact of such differences on engagement inside a global company, and to characterize those impacts if they are found. To address this general objective, the research was ran on a global company of the glass manufacture sector upon global engagement survey applied worldwide on the year of 2022.

Methodological procedures were applied in order to figure out if there is any country granularity differences as a proxy for different informality rules, since they vary on different geographical regions for social, political and cultural influences, the engagement survey answers were analyzed comparing different countries as groups. The result from this first test is that significative differences could be observed and they are strong, even when removing a general positivity bias for each country the general result remains strong, which means that such informal rules have different impacts in each country, so, the first main conclusion is that is very important for any researcher or professional to deeply understand those informal rules at country level, because they are not the same everywhere, and any decision making process must address the characteristics of each country to deliver better results for all the company.

Then, a new data source aggregated by country was made, and data from the engagement survey was added to be compared against engagement survey data, on doing this the size of the sample drops and a new quantitative design was made do address new hypothesis tests using this new source, the ANOVA design was used to detect differences between country groups

and a regression model also using ANOVA was used to check for correlations on the new aggregated data source.

Strong correlations across the engagement surveys are found when aggregating answers by country, as was expected from the strong result observed when comparing only the engagement survey answers by country, so this corroborates with the first result that is important in the decision making process to understand informality rules by country, since the engagement survey results also are different by country, and also correlates with engagement survey results.

In general, the hypotheses used to ascertain in the cross-country cultural variances that come from 18 countries selected seem to indicate an overall strong correlation between the informality rules and their impacts in the organizational engagement on the categories of variables than the variables per se.

This correlation if confirmed in the following researches recommended will be an important finding to the Institutionalists and the Strategic People Management Area. It will represent a mark into the management approaches which extrapolates these constructs. In fact, It will help the academics and practitioners review their strategic orientation prior defining, implementing and analyzing general people standard programs that are usually implemented across the globe without local customization or local nuances analysis.

On top of analyzing the results described already presented, findings are pointing out in the direction of multiple analysis. It means that, informality, culture and engagement are

constructs that must be analyzed together thus the correlation identified is moderate-strong on average. Expand these concepts, future researches should explore how other non-standard concepts must be designed in a multiple approach instead of one discipline perspective.

Finally, using all the information available on both the data sources, more specific tests was made on two strong correlations found between engagement and Societal Practices surveys, and the result are that: 1) on countries with a more positive engagement survey answers for the Assertiveness Societal Practices there is a lower overall engagement level, represented by most of the engagement survey questions. 2) on countries with a more positive engagement survey answers for Collectivism I Societal Practices there is a higher engagement level, represented by questions Q01, Q04 and Q11 on the engagement survey. This may be interpreted as a country focus on Assertiveness Societal Practices may compromise the overall engagement for that country inside the company, while Collectivism Societal Practices focus may improve engagement on at last some specific areas on the same country and company background.

On complementary results, engagement survey values are not correlated with engagement, different from the practices results, at country level and using data observed for the company over that specific time period defined in this research. Another complementary result is that the general positivity bias by country was observed and attenuated, but this positivity bias, as it could not be ignored, is not enough to explain all other results that remains strong.

Despite of the criticism related to the Hofstede´s and Globe searches, it is evident that their researches on the culture perspective is one of the most widely recognized in existence. Their analyses provide academic and practitioners with a quite higher valuable insights into the dynamics of cross-country cultural variances. On the other hand, such a breakthrough huge academic research does not shy away from criticism. Hofstede and Globe have been persecuted by a lot of academics. discrediting their works in part or whole. On the other side of this contentious argument are academics that support his work. Far more scholars belong on the pro-Hofstede team and the Globe Leadership Project than don't, most quote their works with confidence, many including his findings as absolute assumptions (JONES, 2007).

Most of the problems associated with the cross-cultural research are related to overcome many additional factors not inherent in typical research processes, such as: terms used in the research instruments and the simplicity on the methods applied (CAVUSGIL & DAS, 1997). First of all, the wording "culture" which generates multiple interpretations, considering others terminologies used in the questionnaire in addition to the problems related to the local translation which increases the complexity on the responses (OLIE, 1995).

Other criticism are usually related the methodological simplicity which is based on ethnocentric pattern, and they represent a single timeframe only. These errors can provide bias, misinterpretation and inaccuracies. It is complemented by the researchers background that come from only one discipline instead of having a better foundation, digging on multi-disciplinary approach(from to sociology to psychology; from science to economics, etc) (NASIF, 1991).

Additionally, there others arguments against Hofstede and Globe related to relevancy, cultural homogeneity, national divisions, political influence, one company approach, outdated and statistical integrity. Those counterarguments demonstrate that the Hofstede´s and Globe´s researches have been nothing short of highly controversial although they are not without their protagonists and antagonists. At the same time, antagonists declare that one company approach maybe a methodologic criticism, this research considers this item as the great value comparable approach for analyzing the informality rules impact on the organizational engagement discussed on the same multinational company across its countries located around the world (SUTRISNO & DULARIF, 2020).

Indeed, there are three elements that sustain their approaches and their applications and features for selecting and using it to cover the informality´s analysis as the culture proxy in the research presented in this paper. They are as following: (a) their relevance – there was a quite small number of researchers available at the time where a large set of companies just moving their business, playing in the international area where the Hofstede´s and Globe approaches met and exceed this demand for guidance (REISCH, 2021); b) its rigor - The research frameworks used were based on rigorous design with systematic data collection and coherent theory; and (c) their relative accuracy – his research was replicated 61 times and they were analyzed with a quite higher confirmation when comparing with several studies developed and not replicable, but along similar lines, to test the relevancy of Hofstede's and Globe´s questions (KHLIF, 2016).

Assuming the criticism applied to the research into the counterpart to the large set of argument in favor of his approach, this research identifies such of limitations applied to its scope. Although , the study covers a research problem addressed by the multinational companies into the glass packaging market, all the data collected and the analysis conducted were based on the only one company which represents the largest market share and numbers of employees when comparing to the entire market. On top of measuring the impact of the institutions on the organizational engagement, criticisms may be related to the survey used as data basis. Despite of not having a research academy validation so far, the Gallup's Q12 Employee Engagement Survey has been applied for so many years by a large set of largest companies for variety segments in different countries across the globe which support its relevance and rigor on the application and measuring procedures. Even so , the Convergent and Discriminant Validity testing were performed that demonstrated acceptable and robust convergency for all questions analyzed and acceptable internal consistency (the Cronbach's alpha coefficient results: 0,773). The Discriminant Validity Testing results concluded that the engagement survey is composed by questions where all of them are able to discriminate countries in a such level of acceptable data.

Indeed, the engagement measure was not the research focus. However, the research proposed measuring the informal institutions impact on the organizational engagement. These questionnaire was selected due to its amplitude in terms numbers of countries covered, numbers of respondents and large number of years already ran.

For this research, one limitation resides on the data source that analyze operational data, because it comes from a single company, but the company is worldwide and the surveys are applied on a high number of respondents, so, the size of the sample is enough to deal with country dimensionality having sufficient statistical power for the tests, other research on different companies could replicate the methods described here and check what results they found, as general results are expected to be similar (the overall correlations over country and engagement, and between surveys at country level), and specific results may not be the same (the pairwise question correlations) since the informality rules may differ as well.

Other limitation on this research is that it have specific results from the year of 2022, and only one year is used as a source because general results are expected to be similar, but specific results may vary, on adding more years as data sources, another statistical design could fit better, as time series analysis if there is enough years on the database using the same surveys.

After completing the research, the following recommendation should be considered when the new researches will be addressed:

a) Expand the sampling defined, considering other organizations and industrial segments. Despite of the rigor and accuracy relevance of the research outcomes, it was limited by one of the biggest industries in its segment. It represents a small portion of the total amount of the international companies that operates internationally in different locations with cultural variances
b) Add more variables on the aggregated source and try to check different hypothesis, this expansion have the greatest potential as it empowers de decision making processes based on data to be observed, but on doing this the dimensionality issue must be

observed, since aggregated data have a very limited size, this proposed approached may deliver robust results only after data was collected over a long time period.

c) Follow and update this research periodically. This update criteria must be defined, considering global and local changes that come from geographic, society and environmental changes as well. It is relevant to identify how these changes may impact the overall analysis on the informality rules which means in the country cultures and the employee´s engagements in their respective companies

Indeed, findings are pointing out in the direction of multiple analysis. It means that, informality, culture and engagement are constructs that must be analyzed together thus the correlation identified is moderate-strong on average. Expand these concepts, future researches should explore how other non-standard concepts must be designed in a multiple approach instead of the only one discipline perspective.

Hope this thesis may be used for new researches about the dynamics between the informality rules and the organizational engagement and their integrative models and how this discussions impact significantly the current and future business agenda in terms of creating new operating model and bringing advantage competitiveness.

APPENDICES

Appendix A: Engagement Survey

- **Q00**: On a five-point scale, where 5 means extremely satisfied and 1 means extremely dissatisfied, how satisfied are you with your company as a place to work?
- On a five-point scale, where 5 means strongly agree and 1 means strongly disagree, please rate your level of agreement with the following items.
- **Q01**: I know what is expected of me at work.
- **Q02**: I have the materials and equipment I need to do my work right.
- **Q03**: At work, I have the opportunity to do what I do best every day.
- **Q04**: In the last seven days, I have received recognition or praise for doing good work.
- **Q05**: My manager, or someone at work, seems to care about me as a person.
- **Q06**: There is someone at work who encourages my development.
- **Q07**: At work, my opinions seem to count.
- **Q08**: The mission or purpose of my company makes me feel my job is important.
-
- **Q09**: My coworkers are committed to doing quality work.
- **Q10:** I have a best friend at work.
- **Q11**: In the last six months, someone at work has talked to me about my progress.
- **Q12**: This last year, I have had opportunities at work to learn and grow.

Appendix B: Engagement Survey

1) If I were to work at another company, I would be working for all the effort I made to learn the tasks of my current load.

2) If you left this organization, would you feel like keeping up with years of dedication.

3) Leaving this organization would mean, for me, losing an important part of my network of relationships.

4) If I were to work at another company, I would throw away all the exercises I did to get where I got inside that company.

5) One of the reasons why I don't change organizations is the relationships I've already established with colleagues.

6) If I were to work in another company, it would take me a while to be as I am in this company today.

7) I invested too much time in my learning within this organization to leave it now.

8) If I were to work at another company, it would take me a long time to get used to a new role.

9) I think I would have few job alternatives if I left this organization.

10) I stay in this organization because I feel like I couldn't easily get into another organization.

11) I stay in this organization because I feel I have few opportunities in other organizations.

12) It would be difficult to find another job where I could use the work knowledge I acquired in this Company.

13) One of the few consequences of consequences of leaving this organization is the lack of alternatives.

14) My professional profile does not favor my insertion in other organizations.

15) The specificity of my knowledge makes it difficult for me to join other associations.

16) I feel that changing companies would jeopardize my financial stability.

17) Leaving that organization now would result in financial species.

18) If I leave this organization, my stability would be threatened.

19) The benefits we received in this organization would be lost if I left now.

20) What binds me to this organization is the financial benefits it provides me.

21) It wouldn't be easy to find another organization that offers me the same financial return as this.

22) If I were to work in another company, I would give up several benefits that this company offers to its employees (transportation vouchers, medical insurance, meal vouchers, etc).

microdata_source.xlsx		alias				This is an alias for the microdata heatmap source, as last version have the name: 2021Gallup Survey_heatmap_all Countries_2MicroData_v5.xlsx	
aggregated_source.xlsx		alias				This is an alias for the aggregated source, as last version have the name: GLOBE-Phase-2-Aggregated-Societal-Culture-Data.xls	
souce_line	micro_q12	int	categorical	person	microdata_source.xlsx	This is the line number of the data in the source file, keep for backtrack and validation	
country	micro_q12	string	categorical	person	microdata_source.xlsx	This is the country name as it appears on source, capped at 8 chars and changed for UK and USA.	
country_number	micro_q12	int	categorical	person	microdata_source.xlsx	This is a country number, an internal number that can be used to king other agregated data for the same country.	
mean_by_country	micro_q12	float	scalar	country	microdata_source.xlsx	This is the mean for all question, for each one country that the answer came from, replicated at person aggregation level.	
q00	micro_q12	int	ordinal	person	microdata_source.xlsx	This is an unmodified likert 5 scale response (1,2,3,4,5)	Q00: On a five-point scale, where 5 means extremely satisfied and 1 means extremely dissatisfied, how satisfied are you with your company as a place to work?
q01	micro_q12	int	ordinal	person	microdata_source.xlsx	This is an unmodified likert 5 scale response (1,2,3,4,5)	Q01: I know what is expected of me at work.
q02	micro_q12	int	ordinal	person	microdata_source.xlsx	This is an unmodified likert 5 scale response (1,2,3,4,5)	Q02: I have the materials and equipment I need to do my work right.
q03	micro_q12	int	ordinal	person	microdata_source.xlsx	This is an unmodified likert 5 scale response (1,2,3,4,5)	Q03: At work, I have the opportunity to do what I do best every day.
q04	micro_q12	int	ordinal	person	microdata_source.xlsx	This is an unmodified likert 5 scale response (1,2,3,4,5)	Q04: In the last seven days, I have received recognition or praise for doing good work.
q05	micro_q12	int	ordinal	person	microdata_source.xlsx	This is an unmodified likert 5 scale response (1,2,3,4,5)	Q05: My manager, or someone at work, seems to care about me as a person.
q06	micro_q12	int	ordinal	person	microdata_source.xlsx	This is an unmodified likert 5 scale response (1,2,3,4,5)	Q06: There is someone at work who encourages my development.
q07	micro_q12	int	ordinal	person	microdata_source.xlsx	This is an unmodified likert 5 scale response (1,2,3,4,5)	Q07: At work, my opinions seem to count.
q08	micro_q12	int	ordinal	person	microdata_source.xlsx	This is an unmodified likert 5 scale response (1,2,3,4,5)	Q08: The mission or purpose of my company makes me feel my job is important.
q09	micro_q12	int	ordinal	person	microdata_source.xlsx	This is an unmodified likert 5 scale response (1,2,3,4,5)	Q09: My coworkers are committed to doing quality work.
q10	micro_q12	int	ordinal	person	microdata_source.xlsx	This is an unmodified likert 5 scale response (1,2,3,4,5)	Q10: I have a best friend at work.
q11	micro_q12	int	ordinal	person	microdata_source.xlsx	This is an unmodified likert 5 scale response (1,2,3,4,5)	Q11: In the last six months, someone at work has talked to me about my progress.
q12	micro_q12	int	ordinal	person	microdata_source.xlsx	This is an unmodified likert 5 scale response (1,2,3,4,5)	Q12: This last year, I have had opportunities at work to learn and grow.
Q00_DIF	micro_q12	float	scalar	person	microdata_source.xlsx	This is a modified likert 5 scale, where the country mean is subtracted.	Q00: On a five-point scale, where 5 means extremely satisfied and 1 means extremely dissatisfied, how satisfied are you with your company as a place to work?
Q01_DIF	micro_q12	float	scalar	person	microdata_source.xlsx	This is a modified likert 5 scale, where the country mean is subtracted.	Q01: I know what is expected of me at work.
Q02_DIF	micro_q12	float	scalar	person	microdata_source.xlsx	This is a modified likert 5 scale, where the country mean is subtracted.	Q02: I have the materials and equipment I need to do my work right.
Q03_DIF	micro_q12	float	scalar	person	microdata_source.xlsx	This is a modified likert 5 scale, where the country mean is subtracted.	Q03: At work, I have the opportunity to do what I do best every day.
Q04_DIF	micro_q12	float	scalar	person	microdata_source.xlsx	This is a modified likert 5 scale, where the country mean is subtracted.	Q04: In the last seven days, I have received recognition or praise for doing good work.
Q05_DIF	micro_q12	float	scalar	person	microdata_source.xlsx	This is a modified likert 5 scale, where the country mean is subtracted.	Q05: My manager, or someone at work, seems to care about me as a person.
Q06_DIF	micro_q12	float	scalar	person	microdata_source.xlsx	This is a modified likert 5 scale, where the country mean is subtracted.	Q06: There is someone at work who encourages my development.
Q07_DIF	micro_q12	float	scalar	person	microdata_source.xlsx	This is a modified likert 5 scale, where the country mean is subtracted.	Q07: At work, my opinions seem to count.
Q08_DIF	micro_q12	float	scalar	person	microdata_source.xlsx	This is a modified likert 5 scale, where the country mean is subtracted.	Q08: The mission or purpose of my company makes me feel my job is important.
Q09_DIF	micro_q12	float	scalar	person	microdata_source.xlsx	This is a modified likert 5 scale, where the country mean is subtracted.	Q09: My coworkers are committed to doing quality work.
Q10_DIF	micro_q12	float	scalar	person	microdata_source.xlsx	This is a modified likert 5 scale, where the country mean is subtracted.	Q10: I have a best friend at work.
Q11_DIF	micro_q12	float	scalar	person	microdata_source.xlsx	This is a modified likert 5 scale, where the country mean is subtracted.	Q11: In the last six months, someone at work has talked to me about my progress.
Q12_DIF	micro_q12	float	scalar	person	microdata_source.xlsx	This is a modified likert 5 scale, where the country mean is subtracted.	Q12: This last year, I have had opportunities at work to learn and grow.
Country	master_agr	string	categorical	country	aggregated_source.xlsx	This is the country name as it appears on source.	
AGR_MeanQ12	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of all Q12 answers by country.	
AGR_MeanSPractices	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of all societal practices answers by country.	
AGR_MeanSValues	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of all societal values answers by country.	
DIF_Q00Mean	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of engagement survey, by country, where the values are substracted from the overall mean for each country.	Q00: On a five-point scale, where 5 means extremely satisfied and 1 means extremely dissatisfied, how satisfied are you with your company as a place to work?
DIF_Q01Mean	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of engagement survey, by country, where the values are substracted from the overall mean for each country.	Q01: I know what is expected of me at work.
DIF_Q02Mean	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of engagement survey, by country, where the values are substracted from the overall mean for each country.	Q02: I have the materials and equipment I need to do my work right.
DIF_Q03Mean	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of engagement survey, by country, where the values are substracted from the overall mean for each country.	Q03: At work, I have the opportunity to do what I do best every day.
DIF_Q04Mean	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of engagement survey, by country, where the values are substracted from the overall mean for each country.	Q04: In the last seven days, I have received recognition or praise for doing good work.
DIF_Q05Mean	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of engagement survey, by country, where the values are substracted from the overall mean for each country.	Q05: My manager, or someone at work, seems to care about me as a person.
DIF_Q06Mean	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of engagement survey, by country, where the values are substracted from the overall mean for each country.	Q06: There is someone at work who encourages my development.
DIF_Q07Mean	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of engagement survey, by country, where the values are substracted from the overall mean for each country.	Q07: At work, my opinions seem to count.
DIF_Q08Mean	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of engagement survey, by country, where the values are substracted from the overall mean for each country.	Q08: The mission or purpose of my company makes me feel my job is important.
DIF_Q09Mean	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of engagement survey, by country, where the values are substracted from the overall mean for each country.	Q09: My coworkers are committed to doing quality work.
DIF_Q10Mean	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of engagement survey, by country, where the values are substracted from the overall mean for each country.	Q10: I have a best friend at work.
DIF_Q11Mean	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of engagement survey, by country, where the values are substracted from the overall mean for each country.	Q11: In the last six months, someone at work has talked to me about my progress.
DIF_Q12Mean	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of engagement survey, by country, where the values are substracted from the overall mean for each country.	Q12: This last year, I have had opportunities at work to learn and grow.
DIF_Uncertainty_Avoidance_Societal_Practices	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of entrenchment survey, modified by substracting the country mean.	It is a combination of answers presented at Appendix B
DIF_Future_Orientation_Societal_Practices	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of entrenchment survey, modified by substracting the country mean.	It is a combination of answers presented at Appendix B
DIF_Power_Distance_Societal_Practices	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of entrenchment survey, modified by substracting the country mean.	It is a combination of answers presented at Appendix B
DIF_Collectivism_I_Societal_Practices_Institutional_Collectivism	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of entrenchment survey, modified by substracting the country mean.	It is a combination of answers presented at Appendix B
DIF_Humane_Orientation_Societal_Practices	master_agr	float	scalar	country	aggregated_source.xlsx	This is the mean of modified answers of entrenchment survey, modified by substracting the country mean.	It is a combination of answers presented at Appendix B
